Chapter 1. Introduction

The Washington State Department of Transportation (WSDOT) proposes to rebuild the existing Interstate 90 (I-90)/State Route (SR) 18 Interchange and widen SR 18 to Deep Creek. The project will construct a Diverging Diamond Interchange (DDI) at the I-90/SR 18 interchange and will widen SR 18 to four lanes to Deep Creek. In addition, the project will correct fish passage barriers within the project limits and provide stormwater treatment, including retrofit of some existing pavement on SR 18. The project is scheduled to begin construction in the spring of 2022 and end in the fall of 2024.

The I-90/SR 18 interchange is located in the Cascade foothills approximately 25 miles east of Seattle and just south of the City of Snoqualmie (Figure 1).

The purpose of the project is to develop a long-term solution that both improves travel reliability and safety for all vehicles by adding capacity and reducing existing congestion. Aquatic species will have improved access to a minimum of 3.8 miles of lineal habitat (WDFW 2019), as well as restored habitat features in each of the six creeks within the project location with the installation of large wood and the removal of invasive species. This report presents existing conditions for wetlands, streams and buffers in accordance with the WSDOT Environmental Manual (2019). The project will result in temporary and permanent impacts to wetlands and several streams to complete the project; however, impacts and habitat restoration will be covered and detailed in a separate document to support the Joint Aquatic Resources Permit Application. Information in this report facilitates WSDOT efforts to assist project designers in avoiding and/or minimizing impacts to sensitive areas and species; documenting wetland and stream boundary determinations for regulatory reviewers, providing early indicators to project engineers of sensitive fish, wildlife and plant species within the project corridor and offering information required for mitigation reports.

This report is anticipated to support the follow permits, at minimum:

- U.S. Army Corps of Engineers (Corps) Section 404 Permit
- Washington Department of Ecology (Ecology) Section 401 Letter of Verification
- Washington Department of Fish and Wildlife (WDFW) Hydraulic Project Approval
- Coastal Zone Management Certification of Consistency
- King County Shoreline Development Permit

Chapter 2. Proposed Project

Location

The I-90/SR 18 interchange is located about 300 feet south of the City of Snoqualmie, with North Bend to the east and Issaquah to the west (Figure 1). The project is located in township 23 north, range 7 east, and sections 2, 3, 10, 11, and 15. The interchange portion of the project extends approximately from I-90 mileposts (MP) 24.80 to 27.49 and the SR 18 widening portion of the project from SR 18 MPs 25.41 to 27.91 and along Snoqualmie Parkway from CORDI50+00 – CORDI 60+81.22 (Figure 2). The project is outside of the Urban Growth Area (UGA) in King County, Washington with portions of the project occurring on U.S. Forest Service (USFS) land in the Mount Baker-Snoqualmie National Forest, King County property, Washington State Department of Natural Resources (WDNR) parcels, WSDOT right of way, and private property.

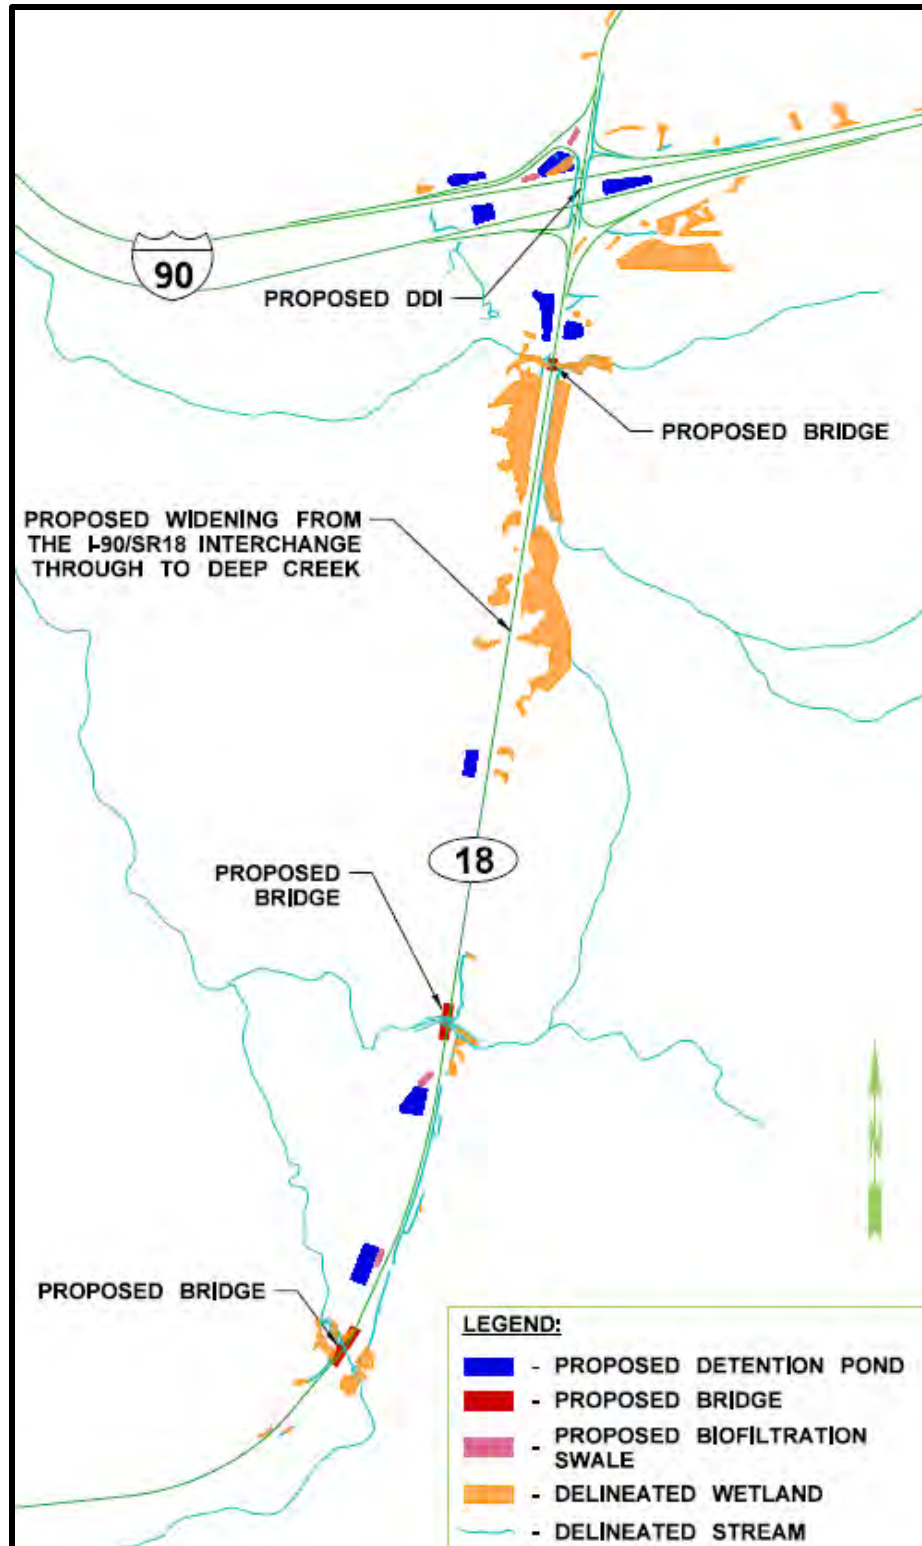

Figure 2. Project Location and Proposed Major Work Elements

Project Description

The project will construct a diverging diamond interchange at the I-90/SR 18 interchange and will widen SR 18 to four lanes to Deep Creek. The project improvements will provide additional capacity at the interchange and along SR 18 to Deep Creek, improve safety, and reduce existing congestion. The project is to begin construction in the spring of 2022 and end in the fall of 2023.

The project is broken into two major components, one is the I-90/SR 18 Interchange and the other is the SR 18 widening to Deep Creek. Major project components and their subcomponents are discussed in the following subsections.

I-90/SR 18 Interchange Diverging Diamond Interchange

A four-lane diverging diamond interchange will replace the existing diamond interchange at I-90 and SR 18. Major work elements between SE 99th St and SE 104th St include roadway, pavement, drainage, signalization, illumination, intelligent transportation system (ITS) devices, signing, striping and landscaping. Within the interchange, six fish passage barriers will be corrected (on the east side of the interchange) and five barriers will be converted to a stormwater conveyance system (on the west side of the interchange). A new stream will be constructed along the east side of the roadway under the I-90 bridges along with new fish passable culverts under the westbound-off and eastbound-on ramps. Flow will be directed from the west side of the interchange to the east side, to increase stream flow and function.

SR 18 Widening to Deep Creek

SR 18 will be widened from three existing lanes to a total of four lanes between SE 104th St. and Deep Creek, with a new intersection control at the intersection of SR 18 and SE 104th St. The existing twin circular concrete culverts at Lake Creek will be replaced with a new bridge, with a minimum 44 foot span to provide fish passage. A new two-lane bridge (approximately 300-foot span) will be constructed for the southbound direction across the Raging River, with the existing Raging River Bridge converted for use as two northbound lanes. A new four-lane bridge (100' minimum hydraulic span) will replace the existing Deep Creek fish passage barrier culvert. SR 18 between Deep Creek and the southern project limit will be reduced to three lanes to tie into the existing three lanes. Other major construction activities include roadway, pavement, drainage, signing, striping, and landscaping. SR 18 is a high stormwater retrofit priority, and this project will exceed the standards from the WSDOT Highway Runoff Manual (HRM).

Raging River Bridge and In-water Work

At the crossing of the Raging River, a new two-lane bridge will be constructed for the two new southbound lanes and the existing bridge will be converted for use by two northbound lanes. The existing bridge is an approximately 300-foot long, 3-span reinforced concrete box girder bridge supported by reinforced concrete columns and drilled shafts. No structural alteration of the existing bridge is anticipated for the project.

The new bridge will be constructed adjacent to the existing structure and will be 38 feet wide to accommodate two travel lanes and shoulders. The total area of the bridge deck will be approximately 11,400 square feet.

Temporary work trestles will be constructed from both ends of the embankments and may cross the river; however, no foundations will be within the ordinary high water mark (OHWM). Therefore, there will be no in-water work at this location.

Deep Creek Bridge and In-water Work

Deep Creek currently flows under SR 18 in a 12-foot-wide, 260-feet-long corrugated steel culvert. The culvert, identified by WDFW as site 07.0396, is listed as fish passage barrier due to slope. The existing culvert will be replaced by a new three-span pre-stressed concrete girder bridge. The new bridge will be approximately 400 feet long and 79 feet wide to accommodate three travel lanes and shoulders. The two southbound lanes will be separated from the northbound lanes by a median barrier. An extra wide shoulder will be constructed on the west side of the bridge to accommodate widening of the roadway across the bridge to four lanes in the future.

Stormwater Treatment

The project improvements at the I-90/SR 18 interchange and SR 18 widening section add impervious area within the project limits. SR 18 is a high stormwater retrofit priority, and this project will exceed the standards from the HRM. Prior to disposal of stormwater to downstream systems, the Project will provide enhanced stormwater treatment and detention to avoid or minimize impacts on surface waters that could result from the increase impervious and PGIS created by the project as per requirements in the HRM. The drainage approach assumes that the existing TDA boundaries and main outfalls within the TDA will be maintained to the extent feasible. The proposed improvements add approximately 13 acres of new PGIS; however, at least 23 acres of PGIS will be treated. As a result of the project, WSDOT anticipates increased stormwater treatment and reduced pollutant runoff.

The following permanent stormwater facilities and BMPs described in the HRM may be used to reduce surface water runoff impacts:

- Stormwater Detention Ponds
- Media Filter Drains
- Compost Amended Biofiltration Swales (CABS).

Approximately 10,000 LF of MFD and seven (7) CABS will treat runoff from added and existing pavement. Nine (9) proposed stormwater detention ponds will provide flow control for pavement added by project improvements and some of the existing pavement.

Fish Passage

The project will address 14 fish passage barriers that will open up nearly 4 miles of fish habitat. At Deep Creek, the existing culvert will be replaced with a structure with a minimum 100-foot hydraulic opening. By correcting the barrier, the WDFW barrier assessment shows a potential upstream habitat gain of 18,017 linear feet. At Lake Creek, the proposed project would replace the two existing culverts with a minimum 44-foot span (hydraulic opening) structure to improve fish passage. WDFW reports 2,168 feet of linear habitat gain above the SR 18 Lake Creek culvert. The project also proposes to construct a series of modifications to an Unnamed Tributary to Lake Creek, removing barriers and enhancing fish habitat throughout the project reach. Six fish passage barriers will be replaced by consolidating the stream into a daylighted channel

between the I-90 westbound off-ramps and the I-90 eastbound on-ramp, including a portion beneath the I-90 eastbound and westbound bridges. This daylighted stream will cross the I-90 westbound off-ramp and I-90 eastbound on-ramp in two fish-passable crossings. The result will be a net reduction of road crossings from six existing barriers to two fish-passable crossings, as well as a minimum upstream habitat gain of 1,720 linear feet in the daylighted stream channel.

Chapter 3. Methods

Wetland and Stream Identification, Delineation and Classification

WSDOT and consultant biologists delineated wetlands and streams according to state and federal laws and policies as outlined by agency technical guidelines and resources in the Environmental Manual (WSDOT 2019). Wetland resources were delineated using guidelines and methods described in the *U.S. Army Corps of Engineers Wetland Delineation Manual* (Environmental Laboratory 1987) as amended with the *Regional Supplement to the Corps of Engineers Wetlands Delineation Manual: Western Mountains, Valleys and Coast Region (Regional Supplement)* (Corps 2014). In general, the wetland delineation consisted of three main tasks: (1) assessing vegetation, soil and hydrologic characteristics to identify areas meeting the wetland criteria, (2) evaluating constructed drainage features to determine if they would be regulated as wetlands or streams, and (3) marking wetland boundaries. Wetland boundaries were identified in the field by WSDOT and consultant biologists and surveyed in the field by survey crews. Wetland location plan sheets were developed for design planning (Appendix A).

Biologists used several tools to conduct a rainfall analysis (NRCS 1997); and to identify and classify plants and soils examined within the study area. Plant indicator status and scientific plant names were identified using the 2018 National Wetland Plant List. Soil characteristics were recorded and classified using methods prescribed by the *Field Book for Describing and Sampling Soils* (USDA, NRCS 2012). Hydric soil conditions were assessed using *Field Indicators of Hydric Soils in the United States, Version 8.2* (USDA, NRCS 2018). Rainfall analysis results were summarized in table format (Appendix B). Vegetation, soil and hydrology information were recorded in the field on wetland data forms (Appendix C).

Wetlands delineated within the study area were classified according to: United States Fish and Wildlife (USFWS) Cowardin classification system (FGDC 2013); Western Washington Wetland (Ecology) Rating System (Hruby 2014) (Appendix D); and the Hydrogeomorphic Approach (HGM) (Brinson 1993). Following wetland delineation and assessment, a plant list was created to reflect species observed in the study area (Appendix E). Wetland functions are discussed in separate document, the Wetland and Buffer Impacts Memorandum.

Streams delineated in the study area were classified according to Washington Administrative Code (WAC) 222-16-030 water typing system as described by Washington State Department of Natural Resources (WDNR 2013). This stream typing system is consistent with the King County Code for Critical Areas (King County 2020). Biologists collected qualitative stream habitat and hydrologic information during the assessment including riparian condition, flow levels, field indicators of flow levels, presence and location of pool/riffle complexes, and observation of fish presence to assist with wetland and stream characterization. Riparian habitat within the project area were also described by WDFW in the Fish Passage Inventory for barriers within the project limits (WDFW 2016). To delineate the OHWM, the bed and adjacent banks of aquatic areas in the study area were examined for indications of regular high water events by qualified biologists trained in the use of ordinary high water determination methods developed by Ecology (Stockdale et al. 2016). Factors considered when assessing changes in vegetation include scour (removal of vegetation and exposure of gravel, sand, or other soil substrate), drainage patterns, elevation of floodplain benches, changes in sediment texture across the floodplain, sediment

WIN#A09070F

layering, sediment or vegetation deposition, and changes in vegetation communities across the floodplain. Streams were classified according to local and state regulations and buffers assigned according to King County (2020). King County Code (KCC) 21A.24.355, Aquatic Areas—Water Types classifies streams into the following classes:

- Type S: All aquatic areas inventoried as "shorelines of the state" under King County's Shoreline Master Program (KCC Title 25) in accordance with Chapter 90.58 Revised Code of Washington (RCW), including segments of streams where the mean annual flow is more than 20 cubic feet per second (cfs), and marine shorelines and lakes are 20 acres in size or larger.
- Type F: All segments of aquatic areas that are not Type S waters and that contain fish or fish habitat, including waters diverted for use by a federal, state, or tribal fish hatchery from the point of diversion for 1,500 feet or the entire tributary if the tributary is highly significant for protection of downstream water quality.
- Type N: All segments of aquatic areas that are not Type S or F waters and that are physically connected to Type S or F waters by an aboveground channel system, stream, or wetland.
- Type O: All segments of aquatic areas that are not Type S, F, or N waters and that are not physically connected to Type S, F, or N waters by an aboveground channel system, pipe, culvert, stream, or wetland.

Fish presence or absence was assessed by reviewing WDNR water type maps, WDFW fish distribution maps, and field observations.

King County stream buffers for areas outside the UGA range from 25 to 165 feet depending on water type (KCC 21A.24.358(C)). Type S or F streams receive a 165-foot buffer; Type N receives a 65-foot buffer; and Type O receives a 25-foot buffer. Stream LC-B and Lake Creek (Stream LC-A) have portions that occur or may occur on USFS property that require stream buffer widths from 100 to 300 feet, depending on fish presence and seasonal or permanent flows (USDA et al. 1994). Buffers in tables and on plan sheets only show King County buffer requirements.

Wetland and stream buffers were determined in the project corridor based on the location of the roadway fill prism (WSDOT 2008), Washington Department of Ecology (Granger et al. 2005), and Washington Department of Natural Resources (WDNR 2013) recommendations for buffer widths. Buffers do not include landscape areas that are functionally disconnected from the stream, wetland, or buffer system, or landscape areas that are functionally obsolete due to the presence of a public roadway. Wetland and stream buffers were applied based on KCC 21A.24.325 (2020). These buffers are dependent on the intensity of impact of adjacent land use and the habitat score of the wetland. For the purpose of this report, buffers were calculated assuming that the adjacent land use, I-90 and SR 18, had a high-intensity impact. Thus, buffer widths range from 50 to 300 feet.

Roadside drainage features were also assessed to determine if they met jurisdictional criteria, and, if so, whether they would be regulated as a wetland, stream or jurisdictional ditch.

Delineation History

A wetland and stream assessment was originally conducted by WSDOT in 2005/2006 and 2011/2012 (WSDOT 2013, Appendix G) for the westbound flyover ramp study area. This investigation identified five streams (Lake Creek [Stream LC-A], and Streams LC-B, LC-C, LC-I, and LC-G) and 20 wetlands. The OHWM of these streams and an additional 12 streams, including the Raging River and Deep Creek, in the study area were re-delineated in 2018 and 2019. At this time, the original 20 wetlands delineated in 2011/2012 were re-verified and 23 additional wetlands were also delineated and rated as described above. Additional streams found on the site were delineated by identifying their OHWMs as described above. A reverification memo was prepared in January 2022 that describes any changes to the wetland delineation or description between the WSDOT 2013 WSAR and the WSDOT 2021 WSAR (Appendix H).

Chapter 4. Existing Conditions

Study Area

The study area for wetlands, streams, and ditches included (Figure 3):

- The I-90/SR 18 Interchange and SR 18 south to Deep Creek (I-90 MP 25.3 to 26.5 and SR 18 MP 25.41 to MP 27.9)
- Landscapes within 300 feet of the roadway prism

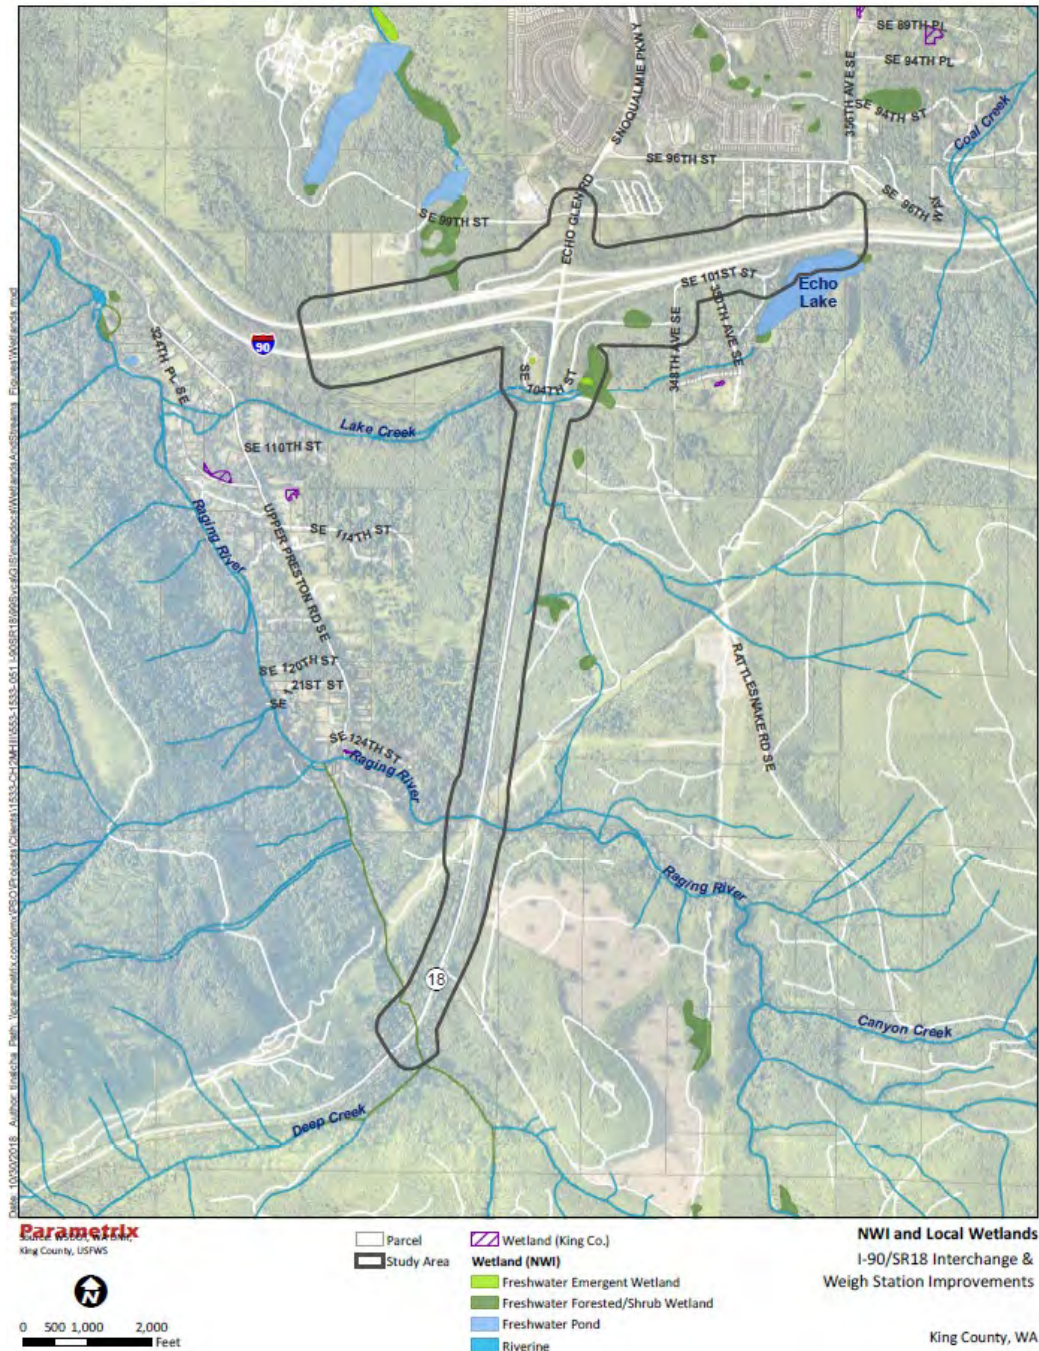

Figure 3. Approximate study area for wetlands and streams
WIN#A09070F

Landscape Setting

The project is situated at the southern extent of the North Cascades Province (Franklin and Dyrness 1988) in foothills on the western slopes of the Cascade Mountains. This region has been shaped by a complex geologic history including inundation by the sea, geologic uplift, glacial activity, development of volcanoes, erosion of soils, and deposition of glacial till in valley bottoms. These geologic processes directly shape the present-day landscape, which is characterized by coniferous forests with many steep-sided mountains and foothills with river valleys below. Soils in the region generally comprise forest soils establishing on top of glaciated material. Soil textures can contain material ranging from very coarse to finer-textured silts and clays.

The project is approximately 15 miles east and inland of Lake Washington and 20 miles west of Snoqualmie Pass. The City of Snoqualmie is less than 300 feet north of the northern extent of the project. Land use in the vicinity of the project is mostly rural residential and active forest land operations, apart from the two highways and the City of Snoqualmie to the north. Parcels surrounding the project are owned primarily by USFS, King County, and WDNR, with some private property north of I-90 and west of Echo Lake.

Watershed Description

The project is in the Upper Snoqualmie River watershed (watershed 1711001004) (BLM 2012) at the upper extent of Water Resource Inventory Area (WRIA) 7 Snohomish (Ecology 2000). Topography in the area varies from valley bottoms to steep hillslopes. The peaks surrounding the project are between 2,000 and 2,700 feet above sea level, with the project between 700 and 900 feet elevation. Rattlesnake Mountain, with a peak of 2,250 feet, lies southeast of the project. This landscape feature generally creates runoff and drainage heading west, contributing hydrologic inputs to the southern quadrants of the project, south of I-90. Echo Lake at the northern toe of the slope of Rattlesnake Mountain drains to Lake Creek, which flows west just south of the I-90/SR 18 interchange. In general, surface water moves from the northeast and northwest project areas flowing south and west, draining first to Lake Creek, then to the Raging River downstream. In addition, surface water moves from the southeast and southwest project areas flowing west, draining to the Raging River via Deep Creek. The contributing basins upstream of the study area for the Raging River, Lake Creek, and Deep Creek are approximately 12.95, 1.65, and 4.45 square miles, respectively (USGS 2018). The Raging River, which receives surface water from the center of the study area, is a tributary of the Snoqualmie River. The confluence of the two rivers is approximately 4.5 linear miles downstream of the project.

Several wetlands are mapped by the National Wetland Inventory (NWI) (USFWS 2014) within the project area (Figure 3). There is a wetland complex which includes freshwater emergent wetland (PEM), freshwater scrub-shrub wetland (PSS), and freshwater forested wetland (PFO) on the southeast corner of the I-90/SR 18 Interchange, south and east of SE 104th St. There are several other smaller wetland complexes mapped within the project area (Figure 3).

Climate and Weather

The study area is situated approximately 23 miles inland from Puget Sound. The project lies in the foothills of the Cascade Mountains. A cool marine climate produced by Puget Sound results in cool, dry summers and wet, mild winters. The general area receives an average total snowfall of about 7 inches per year and an overall total of 57 inches of precipitation per year, as recorded at the Landsburg weather station, with most of the precipitation occurring between September and June (NRCS 2002; WSDOT 2013).

Normal conditions were present for 3 months prior to the wetland delineations in October 2018, July 2019 and August 2019, based on rainfall data from the Landsburg weather station (NRCS 2019b) (Appendix B). Precipitation observed at the Landsburg weather station was drier than normal throughout the wetland delineations in August 2018, September 2018, and June 2019 (NRCS 2019b) (Appendix B). Hydrology indicators at the time of the delineation would have been informative. All wetlands in the study area met all three delineation criteria.

Vegetation

The study area is primarily forested upland and wetland areas associated with Deep Creek, the Raging River, Lake Creek, and their tributaries, with WDNR forest land and rural residences adjacent to the riparian corridor. The areas closest to I-90 and SR 18 are primarily road fill material, with reed canarygrass (*Phalaris arundinacea*), osoberry (*Oelmeria cerasiformis*), Himalayan blackberry (*Rubus armeniacus*) and western swordfern (*Polystichum munitum*) dominating vegetation adjacent to the roadway prism. Other dominant species in the study area include cottonwood (*Populus balsamifera*), Douglas fir (*Pseudotsuga heterophylla*), Western hemlock (*Tsuga heterophylla*), salmonberry (*Rubus spectabilis*), and salal (*Gaultheria shallon*). Please refer to Appendix E for a complete species list.

Growing Season

The growing season in the region is heavily influenced by the Pacific Ocean and typically lasts between 180 to 196 days long. The average, frost-free growing season generally occurs from late March (March 25) to mid-November (November 15), totaling 180 days. Several features were observed during the wetland delineation to determine the growing season in the study area, including observing herbaceous plants to be green on the ground, and leaves on trees were observed during delineations during the growing season.

Soils

Six soil types were identified and mapped within the study area (Figure 4):

- Klaber silt loam, 0 to 8 percent slopes (Hydric rating: 100)
- Klaus sandy loam, 0 to 8 percent slopes (Hydric rating: 1)
- Seattle muck, 0 to 1 percent slopes (Hydric rating: 100)
- Tokul gravelly medial loam, 8 to 15 percent slopes (Hydric rating: 5)
- Tokul gravelly medial loam, 15 to 30 percent slopes (Hydric rating: 0)
- Tokul-Pastik complex, 45 to 90 percent slopes (Hydric rating: 0)

The predominant soil types mapped within the study area are Tokul gravelly medial loam, 8 to 15 percent slopes and 15 to 30 percent slopes. The Tokul series consists of moderately well-
WIN#A09070F

drained soils that occur on the west slopes of the Cascade Mountains in northwestern Washington. This soil type typically does not have hydric soil conditions (NRCS 2019a).

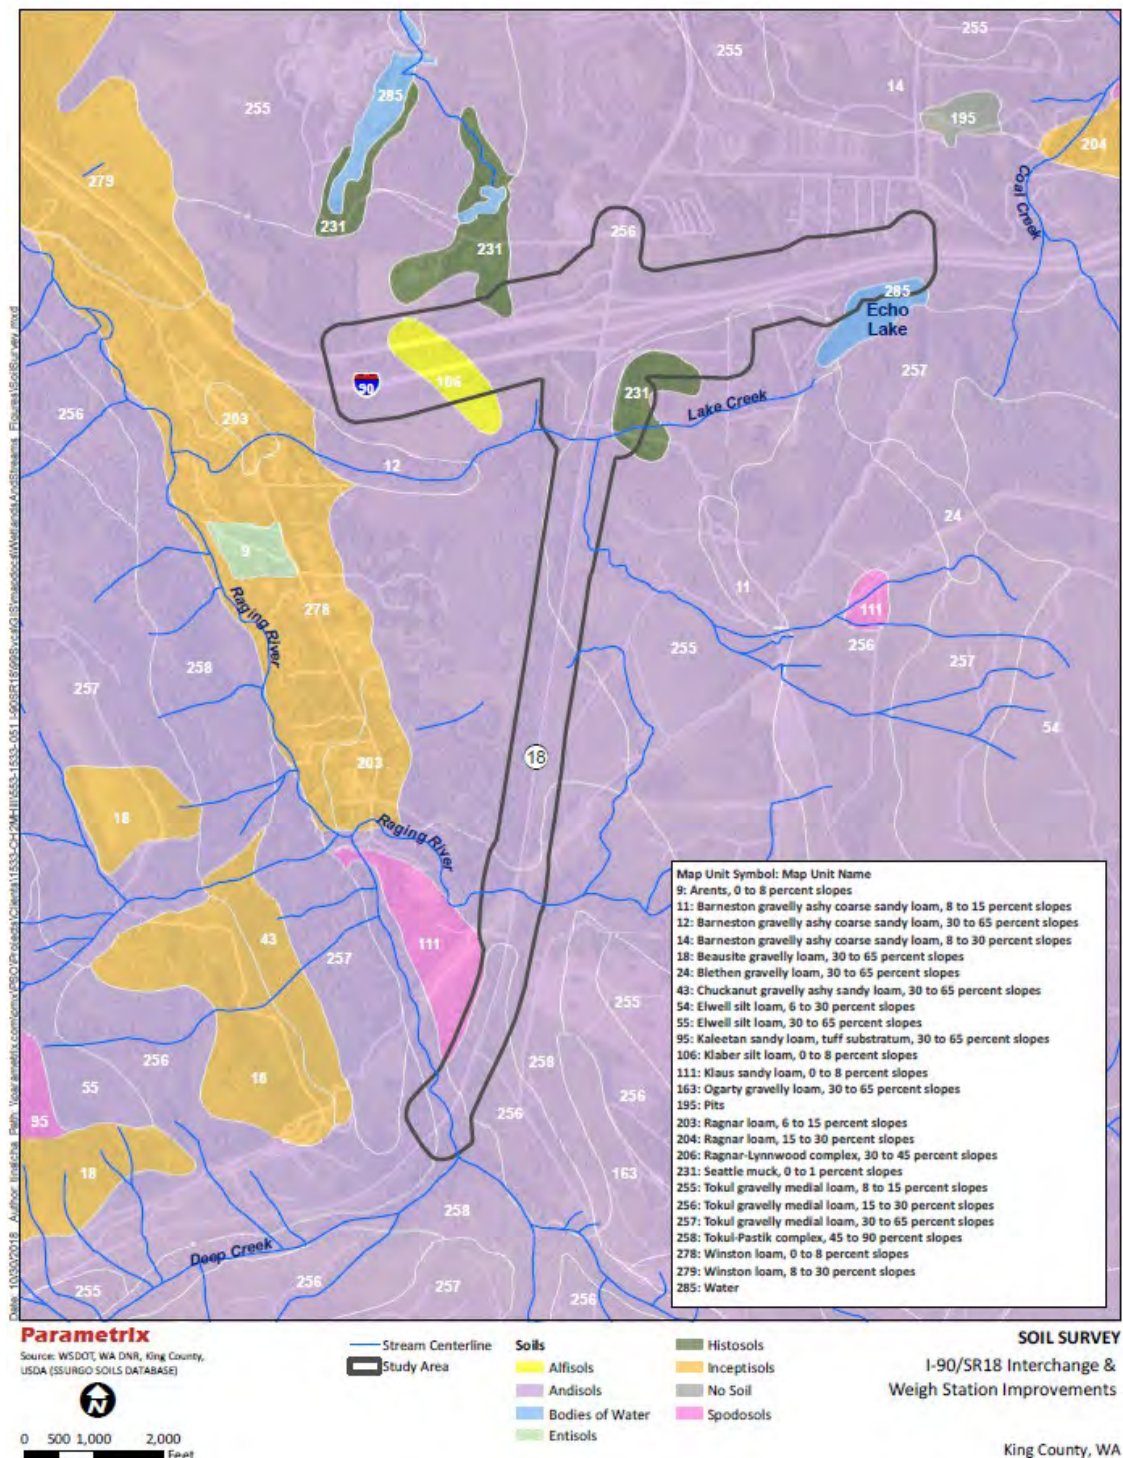

Figure 4. Mapped NRCS Soils

WIN#A09070F

I-90/SR 18 I/C to Deep Creek – I/C Improvements and Widening
Wetland and Stream Assessment Report

Delineated Wetlands and Streams

In total, 43 wetlands and 20 streams were delineated within the study area (see wetland summary in Table 1 and stream summary in Table 43 and Figure 5 below). Biologists completed field data sheets (Appendix C) and Ecology wetland rating forms (Appendix D) for all delineated wetlands. A list of plants encountered in wetlands was compiled for the study area (Appendix E). Wetlands are presented and named by drainage basin with a breakout map for each basin followed by the wetland summary tables provide a summary of data collected that drove decisions for placing wetland boundaries and assessing wetland conditions (Tables 2-42).

I-90/SR 18 I/C to Deep Creek – I/C Improvements and Widening
Wetland and Stream Assessment Report

Table 2. Wetland LC-01 Summary

WETLAND LC-01 – INFORMATION SUMMARY			
Location:		SW quadrant of I-90/SR 18 intersection, west of westbound SR 18	
	Delineation/Verification Date		October 31, 2011/2018
	Local Jurisdiction		King County
	WRIA		7 Snohomish
	Ecology (2014) Rating		I
	King Co. Buffer Width		300 feet
	Wetland Size (sf/acres)		34,374/0.79
	Cowardin Classification		PFO/PSS
	HGM Classification		Depressional
	Wetland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W1-SP1
	Upland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W1-SP2
Dominant Vegetation		Trees – western red cedar (<i>Thuja plicata</i>). Sapling/shrubs – salmonberry (<i>Rubus spectabilis</i>), red huckleberry (<i>Vaccinium parvifolium</i>). Herbaceous – American skunk-cabbage (<i>Lysichiton americanus</i>), water parsley (<i>Oenanthe sarmentosa</i>), with western swordfern (<i>Polystichum munitum</i>) on hummocks. Non-vascular - sphagnum moss (<i>Sphagnum</i> sp.).	
Soils		Soil matrices of 10YR 2/1 with redoximorphic concentrations, hereinafter referred to as concentrations, to greater than 18 inches. Indicator Redox Dark Surface (F6). Some locations had soils with high organic content. Indicator F1: Loamy Mucky Mineral.	
Hydrology		Wetland situated in a forested depression below and to the west of SR 18 with a high water table as the dominant hydrology source. Precipitation and stormwater runoff from SR 18 contribute secondary hydrologic inputs. Water leaves the wetland through a constricted outlet (culvert) that flows east under SR 18 into LC-28.	
Rationale for Delineation		Depressional wetland with hydric soils, supports hydrophytic vegetation, and wetland hydrology. Topographic break near toe of slope of the depression and obvious change in vegetation community helped determine wetland boundary.	
Rationale for Local Rating		King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-01 is Category I based on functions. Organic soils and sphagnum moss present in some areas; however, does not meet special characteristics criteria for bogs in the Washington State Wetland Rating System due to the vegetation community not having the characteristic bog species.	
Wetland Functions Summary			
Water Quality		High potential to trap sediments due to large size, constricted outlet (culvert), and ability to retain significant amounts of water; high opportunity because wetland receives overland flow of surface water during and following storms. High potential to trap nutrients and toxicants due to due to densely vegetated topographic depression with high organic content in soils; high opportunity because wetland receives stormwater runoff from SR 18 through its vegetated buffer (<50 feet wide in places).	
Hydrologic		Moderate potential to alter flood flow due to landscape position high in watershed and depressional topography that retain high volumes of water; opportunity is moderate from run-on during precipitation and snow melt events. Moderate erosion control and shoreline stabilization functions provided because wetland shares a hydrologic surface connection with Wetland LC-28, a headwater to Stream LC-B.	
Habitat		High habitat quality due to connection with large mature forested upland corridor, other wetlands and Raging River. WDFW Priority Habitats and Species (PHS) present.	
Buffer Condition		Buffer function is high. Greater than half of the wetland circumference to the west consists of mature coniferous forest dominated by western red cedar and western hemlock (<i>Tsuga heterophylla</i>), intermixed with some historically logged areas where trees and shrubs have reestablished. The eastern wetland boundary is buffered by a thin strip of mature coniferous trees separating the wetland from the westbound lanes of SR 18. These forested areas provide wildlife habitat, shade, organic matter inputs, and some water quality and hydrologic buffering from stormwater runoff.	

Table 3. Wetland LC-02 Summary

WETLAND LC-02 – INFORMATION SUMMARY			
Location:	SW quadrant of I-90/SR 18 intersection, west of westbound SR 18		
	Delineation/Verification Date	October 31, 2011/2018	
	Local Jurisdiction	King County	
	WRIA	7 Snohomish	
	Ecology (2014) Rating	II	
	King Co. Buffer Width	150 feet	
	Approximate Wetland Size (sf/acres)	660/0.015	
	Cowardin Classification	PSS/PEM	
	HGM Classification	Depressional	
	Wetland Data Sheets	WSDOT 2013; Appendix C; Sampling Point W2-SP1	
	Upland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W2-SP2	
Dominant Vegetation	Trees – red alder (<i>Alnus rubra</i>). Sapling/shrubs – salmonberry. Herbaceous – slough sedge (<i>Carex obnupta</i>), common ladyfern (<i>Athyrium filix-femina</i>).		
Soils	Soil matrices were depleted with 2.5Y 6/1 with concentrations to greater than 16 inches. Indicator Depleted Matrix (F3).		
Hydrology	Wetland situated in a depression below and to the west of SR 18 with a high water table as the dominant hydrology source. Precipitation and stormwater runoff from SR 18 contribute secondary hydrologic inputs. Water leaves the wetland through a constricted outlet at a culvert flowing east under SR 18, emptying into Wetland LC-28, the headwaters of Stream LC-B.		
Rationale for Delineation	Depressional wetland with hydric soils, supports hydrophytic vegetation, and wetland hydrology. Topographic break near toe of slope of the depression and obvious change in vegetation community helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-02 is Category II.		
Wetland Functions Summary			
Water Quality	Moderate potential to trap sediments due to depressional topography with dense herbaceous vegetation and a constricted outlet (a culvert), allowing for significant ponding and fine sediments to settle out of the water column; high opportunity because wetland receives overland flow of surface water during and following storms. High potential to trap nutrients and toxicants due to the same physical characteristics described for sediment trapping function, though overall size of wetland is small, reducing its ability to perform this function; high opportunity because wetland receives stormwater runoff from SR 18.		
Hydrologic	Moderate potential to alter flood flow due to small size; opportunity is moderate as significant amounts of water drain into the wetland from up-slope areas during and following precipitation. Moderate erosion control and shoreline stabilization functions are provided because wetland shares a hydrologic surface connection with Wetland LC-28, a headwater to Stream LC-B.		
Habitat	Moderate habitat quality. Wetland is connected to a large upland forested corridor that connects to other wetlands and Raging River. Function limited by wetland size. Wetland provides habitat for aquatic invertebrates; breeding, juvenile, and adult amphibians; passerine birds; small mammals; and deer.		
Buffer Condition	Buffer function is high. Approximately half of the wetland circumference to the west consists of mature forest dominated by western red cedar and red alder, intermixed with some historically logged areas where trees and shrubs have reestablished. The eastern half of the wetland boundary is buffered by a thin strip of mature coniferous trees separating the wetland from the westbound lanes of SR 18. These forested areas provide wildlife habitat, shade, organic matter inputs, and some water quality and hydrologic buffering from stormwater runoff.		

Table 4. Wetland LC-03 Summary

WETLAND LC-03 – INFORMATION SUMMARY			
Location:	SW quadrant of I-90/SR 18 intersection, west of westbound SR 18		
	Delineation/Verification Date	October 31, 2011/2018	
	Local Jurisdiction	King County	
	WRIA	7 Snohomish	
	Ecology (2014) Rating	I	
	King Co. Buffer Width	300 feet	
	Wetland Size	0.39 acre	
	Cowardin Classification	PFO/PSS	
	HGM Classification	Depressional	
	Wetland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W3-SP1	
	Upland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W3-SP2	
Dominant Vegetation	Trees – western red cedar. Sapling/shrubs – devil’s club (<i>Oplopanax horridus</i>), salmonberry, western red cedar saplings. Herbaceous – common ladyfern, western swordfern on hummocks, Pacific trillium (<i>Trillium ovatum</i>). Non-vascular - sphagnum moss present.		
Soils	Soil matrices were 10YR 3/1 with concentrations to greater than 16 inches. Indicator Redox Dark Surface (F6). High organic matter present in some areas.		
Hydrology	Wetland situated in a forested closed depression below and west of SR 18 with a high water table as the dominant hydrology source. Precipitation and stormwater runoff from SR 18 contribute secondary hydrologic inputs. The wetland has no outlet, indicating water leaves through infiltration and evapotranspiration.		
Rationale for Delineation	Depressional wetland with hydric soils, supports hydrophytic vegetation, and wetland hydrology. Topographic break near toe of slope of the depression and obvious change in vegetation community helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-03 is Category I. Soils with high organic content and sphagnum moss present in some areas of the wetland; however, does not meet the bog criteria for special characteristics in the Washington State Wetland Rating System due to the vegetation community not having the characteristic bog species.		
Wetland Functions Summary			
Water Quality	High potential to trap sediments due to closed depressional topography, dense vegetation, and seasonal ponding, which allow fine sediments to settle out of the water column; moderate opportunity because wetland receives overland flow of surface water during and following storms. High potential to trap nutrients and toxicants due to densely vegetated topographic closed depression with high organic content in soils; moderate opportunity because portions of the wetland receive stormwater runoff from SR 18.		
Hydrologic	High potential to alter flood flow due to landscape position high in watershed and depressional topography able to retain high volumes of water; opportunity is high from run-on during precipitation events. Erosion control and shoreline stabilization functions not provided because wetland lacks hydrologic surface connection with a stream.		
Habitat	High habitat quality due to connection with large mature forested upland corridor, other wetlands and Raging River. Forested wetland with canopy stratification, decadence, various water regimens, and other characteristics able to support various wildlife. Wetland has uniqueness and heritage: Category I forested and PHS present.		
Buffer Condition	Buffer function is high. Greater than half of the western wetland circumference consists of mature coniferous forest dominated by western red cedar and western hemlock, intermixed with some historically logged areas where trees and shrubs have reestablished. The eastern wetland boundary is buffered by a thin strip of mature coniferous trees separating the wetland from the westbound lanes of SR 18. These forested areas provide wildlife habitat, shade, organic matter inputs, and some water quality and hydrologic buffering from stormwater runoff.		

Table 5. Wetland LC-04 Summary

WETLAND LC-04 – INFORMATION SUMMARY			
Location:	SW quadrant of I-90/SR 18 intersection, west of westbound SR 18		
	Delineation/Verification Date		October 31, 2011/2018
	Local Jurisdiction		King County
	WRIA		7 Snohomish
	Ecology (2014) Rating		I
	King Co./USFS Buffer Width		150 feet/150 feet
	Wetland Size		6.45 acres
	Cowardin Classification		PFO
	HGM Classification		Depressional/Riverine
	Wetland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W4-SP1, W4-SP3
	Upland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W4-SP2, W4-SP4
Dominant Vegetation	Trees – red alder, black cottonwood (<i>Populus balsamifera</i>), Cascara buckthorn (<i>Frangula purshiana</i>), vine maple (<i>Acer circinatum</i>). Sapling/shrubs – salmonberry, Pacific ninebark (<i>Physocarpus capitatus</i>). Herbaceous – youth on age (<i>Tolmiea menziesii</i>), sedges (<i>Carex</i> spp.), common ladyfern.		
Soils	Soil matrices were 10YR 2/1 and 10YR 3/2 to five inches. A second layer from 5 to 16 inches with a depleted matrix of 10YR 5/2 with concentrations and depletions is present. Indicators Depleted Below Dark Surface (A11) and Depleted Matrix (F3).		
Hydrology	Wetland situated in a forested depression with Lake Creek running through it. It is below and to the west of SR 18. A high water table is the dominant hydrology source. Precipitation, hyporheic flow and occasional overbank flooding from Lake Creek, and stormwater runoff from SR 18 contribute secondary hydrologic inputs to portions of the wetland. Parts of the wetland have no outlet, while other areas outlet to Lake Creek.		
Rationale for Delineation	Depressional and riverine wetland with hydric soils, supporting hydrophytic vegetation, and wetland hydrology. Obvious change in vegetation community and hydric soils helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-04 is Category I. It is Category I based on special characteristics for mature forested wetland and Category II based on functions.		
Wetland Functions Summary			
Water Quality	High potential to trap sediments due to large size and ability to retain significant amounts of water; moderate opportunity because wetland receives runoff from multiple sources including Lake Creek during and following storms. High potential to trap nutrients and toxicants due to densely vegetated topographic depression with some organic content in soils; moderate opportunity because portions of the wetland receive stormwater runoff from SR 18.		
Hydrologic	High potential to alter flood flow due to landscape position high in watershed and depressional and undulating topography able to retain water; opportunity is high due to flood overflow from Lake Creek and stormwater inputs. Moderate erosion control and shoreline stabilization functions provided because Lake Creek flows through the wetland.		
Habitat	High habitat quality due to connection with large mature forested upland corridor, other wetlands and Lake Creek. Mature forested wetland with canopy stratification, decadence, various water regimens, and other characteristics able to support various wildlife including fish, wetland mammals, amphibians, large and small land mammals, and passerine birds. Wetland has uniqueness and heritage: Category I Mature Forested greater than 1 acre and WDFW PHS present.		
Buffer Condition	Buffer function is high. Greater than half of the western wetland circumference has mature coniferous forest dominated by western red cedar, western hemlock, Douglas-fir (<i>Pseudotsuga menziesii</i>), and vine maple intermixed with some historically logged areas where trees and shrubs have reestablished. The eastern wetland boundary is buffered by a thin strip of mature coniferous trees separating the wetland from the westbound lanes of SR 18 and the southern portion of the WSDOT maintenance yard. These forested areas provide wildlife habitat, shade, organic matter inputs, and some water quality and hydrologic buffering from stormwater runoff.		

Table 6. Wetland LC-05 Summary

WETLAND LC-05 – INFORMATION SUMMARY		
Location:	SW quadrant of I-90/SR 18 intersection, south end of WSDOT maintenance yard	
	Delineation/Verification Date	October 22, 2012/2018
	Local Jurisdiction	King County
	WRIA	7 Snohomish
	Ecology (2014) Rating	III
	King Co. Buffer Width	150 feet
	Wetland Size	0.10 acre
	Cowardin Classification	PSS/PEM
	HGM Classification	Slope
	Wetland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W5-SP1, W5-SP3
	Upland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W5-SP2
Dominant Vegetation	Trees – none. Sapling/shrubs – hardhack (<i>Spiraea douglasii</i>), black cottonwood, willows (<i>Salix</i> spp.), cutleaf blackberry (<i>Rubus laciniatus</i>). Herbaceous – poverty rush (<i>Juncus tenuis</i>), tapertip rush (<i>Juncus acuminatus</i>), sedges, woolgrass (<i>Scirpus cyperinus</i>), spike bentgrass (<i>Agrostis exarata</i>), common velvetgrass (<i>Holcus lanatus</i>).	
Soils	Soil matrices were 10YR 2/2 to 7 inches. A second layer from 7 to 13 inches had a matrix of 10YR 3/3 with concentrations. Soils are significantly disturbed but are assumed to be hydric because soils meet the definition: saturated or ponded for long periods during the growing season. In addition, presence of a hydrophytic plant community and wetland hydrology indicate that the soils are hydric.	
Hydrology	Wetland situated in disturbed sloping area on WSDOT maintenance yard. Surface run-on from precipitation from up-slope maintenance yard is the primary source of hydrology. Water saturates the upper portion of the soil and small depressions impound water. Water leaves the wetland sheet flowing across the access road to the maintenance yard, and enters a ditch, before draining to Lake Creek.	
Rationale for Delineation	Slope wetland supporting hydrophytic vegetation and wetland hydrology. This is a newly forming wetland area due to activities associated with the WSDOT maintenance yard. Soil excavation in this area allows water to pond and subsequently a hydrophytic plant community has established.	
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-05 is Category III.	
Wetland Functions Summary		
Water Quality	High potential to trap sediments due to gentle sloping topography with depressions and dense herbaceous vegetation, allowing water to move through system relatively slowly and fine sediments to settle out of the water column; high opportunity because WSDOT maintenance yard is directly upslope, with the majority of sheet flow off the maintenance yard flowing through wetland before entering Lake Creek. High potential to trap nutrients and toxicants due to sloping topography with depressions and dense herbaceous vegetation; high opportunity because maintenance yard upslope contributes inputs.	
Hydrologic	Moderate potential to alter flood flow due to small densely vegetated depressions able to retain runoff; opportunity is moderate as wetland receives surface runoff from up-slope maintenance but water leaves wetland as sheetflow across access road flowing to ditch draining to Lake Creek. Erosion control and shoreline stabilization functions not provided because wetland lacks hydrologic surface connection with a stream.	
Habitat	Low habitat quality due to lacking or low-functioning buffer, surrounding WSDOT maintenance yard, and small wetland size.	
Buffer Condition	Buffer function is limited for the entire circumference of the wetland. Half of the wetland lacks a buffer and is bordered by a gravel road accessing the WSDOT maintenance yard. The other half has a sloping buffer on the southern end of the maintenance yard with disturbed/compacted soils dominated by upland pasture grasses and some invasive species. Upland grasses to the north may provide some hydrologic and water quality functions.	

Table 7. Wetland LC-06 Summary

WETLAND LC-06 – INFORMATION SUMMARY			
Location:	Northwest of the I-90/SR 18 Interchange and to the west of decommissioned weigh station		
	Delineation Date	October 24, 2018	
	Local Jurisdiction	King County	
	WRIA	7 Snohomish	
	Ecology (2014) Rating	III	
	King County Buffer Width	150 feet	
	Approximate Wetland Size (sf/acres)	>8,250/0.19	
	Cowardin Classification	PFO/PSS	
	HGM Classification	Depressional	
	Wetland Data Sheets	Appendix C; Sampling Point 34	
Upland Data Sheets	Appendix C; Sampling Point 35 and 36		
Dominant Vegetation	Trees—Western red cedar, black cottonwood, and red alder. Sapling/shrubs —salmonberry, hardhack, trailing blackberry, twinberry honeysuckle, Pacific ninebark, Cascara buckthorn, and vine maple. Herbaceous—American skunk-cabbage, American speedwell (<i>Veronica Americana</i>), stinging nettles (<i>Urtica dioica</i>), and water parsley.		
Soils	Soils within Wetland LC-06 generally had two layers. The surface layer (0 to 7 inches) was 10YR 2/1 silt loam. The second layer (7 to 16 inches) was 10YR 3/2 loam 7.5YR 4/6 concentrations. These soils met the criteria for hydric soil indicators F6 (redox dark surface).		
Hydrology	A high water table is the primary source of hydrology for Wetland LC-06. Additional hydrologic inputs include ephemeral overland flow from the north and precipitation. Water from Wetland LC-06 flows into a catch basin and is conveyed from the north to south under I-90 and into Stream LC-D. Depth of ponding is between 0.5 and <2 feet deep.		
Rationale for Delineation	Depressional wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.		
Rationale for Local Rating	Wetland LC-06 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.		
Wetland Functions Summary			
Water Quality	Low site potential for water quality improvement due to minor seasonal ponding and lower coverage of persistent vegetation; moderate potential for water quality improvement within the landscape due to reception of stormwater discharges.		
Hydrologic	Low site potential for hydrologic function due to lack of ponding; moderate landscape potential to support hydrologic functions because of stormwater inputs into the wetland. Societal value is high because flooding occurs in the sub-basin immediately downgradient of Wetland LC-06.		
Habitat	Moderate habitat quality with scrub-shrub plant communities and multiple hydroperiods and low habitat interspersions. Special habitat features include large downed wood and snags that benefit small mammals and amphibians such as salamanders and a variety of birds.		
Buffer Condition	Wetland LC-06 buffer is partially limited by SR 18; remaining buffer is relatively undisturbed forest consisting primarily of western hemlock and Douglas-fir. Wetland LC-06 is part of a relatively undisturbed vegetated corridor, which connects to other wetlands and to undisturbed uplands greater than 25 acres in size.		

Table 8. Wetland LC-07 Summary.

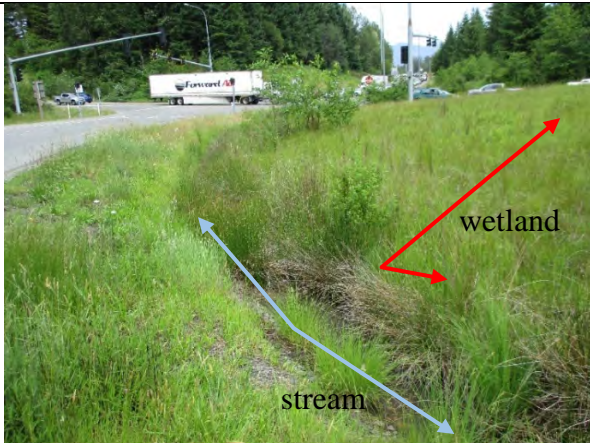

WETLAND LC-07 – INFORMATION SUMMARY			
Location:		Northwest of the I-90 overpass and south of the westbound onramp.	
	Delineation Date		June 20, 2019
	Local Jurisdiction		King County
	WRIA		7 Snohomish
	Ecology (2014) Rating		III
	King Co. Buffer Width		80 feet
	Wetland Size (sf/acres)		15,595/0.358
	Cowardin Classification		PEM
	HGM Classification		Slope
	Wetland Data Sheet(s)		Sampling Point W41-SP2, W41-SP4, and W41-SP6
Upland Data Sheet (s)		Sampling Point W41-SP1, W41-SP3, and W41-SP5	
Dominant Vegetation		Trees- none. Sapling/shrubs - hardhack (5% cover). Herbaceous - colonial bentgrass, sweet vernalgrass (<i>Anthoxanthum odoratum</i>), soft rush (<i>Juncus effusus</i>).	
Soils		Soils examined to a depth of 8-12 inches exhibited hydric characteristics. Dark 10YR 3/2 soils from 0 to 4 inches. Depleted matrices of 7.5YR 5/1 and 2.5Y 5/1 with concentrations present from 4 to 8-12 inches underlain by a restrictive layer of cobbles and gravel. Indicators Depleted Matrix (F3) and Depleted Below Dark Surface (A11) met.	
Hydrology		Precipitation and stormwater sheet flow on top of a restrictive layer appear to be the main sources of hydrology. Water leaves the wetland as sheet flow into the roadside ditch at the toe of the slope.	
Rationale for Delineation		Positive indicators of hydrophytic vegetation and hydric soils present. Hydrology is naturally problematic due to the site visit occurring during the normal annual dry season, however conditions 2f and 3a are met for wetlands that periodically lack indicators of wetland hydrology (Corps 2010). Placement of boundary determined by vegetation and soils.	
Rationale for Local Rating		King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-07 is Category III.	
Wetland Functions Summary			
Water Quality		Low potential for production of organic matter and its export due to >90% cover of dense herbaceous vegetation across the wetland. A surface water outlet to a roadside ditch has the potential to readily export organic material to down-gradient habitats. Diversity and interspersed vegetation is low.	
Hydrologic		No potential to alter flood flow or low ability to provide sediment removal due to small size and sloping topography. Erosion control and shoreline stabilization not provided because wetland is not associated with a water course or shoreline.	
Habitat		No potential to provide habitat functions due to fragmentation by development, low diversity of plant species, and only one Cowardin Class present.	
Buffer Condition		Buffer function is limited. The wetland is bordered by an onramp to I-90 to the north and west, SR 18 to the east, and I-90 to the south.	

Table 9. Wetland LC-11 Summary

WETLAND LC-11 – INFORMATION SUMMARY			
Location:	NE quadrant of I-90/SR 18 intersection, north of eastbound I-90 off-ramp at Exit 25		
	Delineation/Verification Date		October 31, 2011/2018
	Local Jurisdiction		King County
	WRIA		7 Snohomish
	Ecology (2014)		III
	King Co. Buffer Width		150 feet
	Wetland Size		0.16 acre
	Cowardin Classification		PFO/PSS
	HGM Classification		Depressional
	Wetland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W13-SP1
	Upland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W13-SP2
Dominant Vegetation	Trees – black cottonwood, vine maple, Cascara buckthorn. Sapling/shrubs – salmonberry, vine maple, devil’s club. Herbaceous - western swordfern, common ladyfern, trailing blackberry.		
Soils	Soil matrices were 10YR 3/1 to greater than 16 inches with concentrations. Indicator Redox Dark Surface (F6).		
Hydrology	Depressional wetland with a highly constricted outlet situated on a forested terrace above and to the east of SR 18 with a high water table as the dominant hydrology source. Precipitation contributes secondary hydrologic inputs. Outlet flow to a ditch draining to LC-12.		
Rationale for Delineation	Depressional wetland with hydric soils, supports hydrophytic vegetation, and wetland hydrology. Topographic break near toe of slope of the depression and vegetation helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-11 is Category III.		
Wetland Functions Summary			
Water Quality	High potential to trap sediments due to densely vegetated depression with a constricted outlet, allowing water to move through system relatively slowly and fine sediments to settle out of the water column; low opportunity because significant sources of sediments are not present in surrounding intact upland forest areas. High potential to trap nutrients and toxicants due to densely vegetated depressional topography and mineral soils with high organic content; low opportunity because stormwater runoff from roadways or other sources does not enter the wetland.		
Hydrologic	High potential to alter flood flow due to vegetated depressional topography with a highly constricted outlet; high opportunity as wetland captures and slows runoff from upland forest areas during and following precipitation events. Erosion control and shoreline stabilization functions are high because of flooding problems downstream.		
Habitat	High habitat quality due to habitat connectivity with other forested uplands and wetlands. Good canopy stratification and variable water regimen throughout the growing season provide habitat for passerine birds, small mammals, amphibians, and deer.		
Buffer Condition	Buffer function is high for the entire circumference of the wetland with mature forest providing wildlife habitat, shade, and organic matter inputs. Red alder, western hemlock, and bigleaf maple (<i>Acer macrophyllum</i>) dominate the over story with salmonberry, vine maple, and red huckleberry (<i>Vaccinium parvifolium</i>) in the shrub layer. The wetland is up-slope from I-90 and does not receive stormwater or have other sources of poor water quality inputs.

	Wetland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W14-SP1, W14-SP3	
	Upland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W14-SP2, W14-SP4	
Dominant Vegetation	Trees – red alder, black cottonwood. Sapling/shrubs – salmonberry, vine maple, Cascara buckthorn. Herbaceous - youth on age, common ladyfern, trailing blackberry, sedges, scouring rush horsetail (<i>Equisetum hyemale</i>), and reed canarygrass.		
Soils	Soils from in the upper two layers were 10YR 2/1 or 10YR 3/2. Concentrations present in some layers. Two different soil types were observed in different areas of the wetland. Some had high organic content in loamy mucky mineral soils meeting Indicator Loamy Mucky Mineral (F1), while others had higher mineral content meeting Indicator Redox Dark Surface (F6).		
Hydrology	Depressional and slope wetland situated in a forested drainage above and to the north of I-90 with a high water table and surface and subsurface run-on as the dominant hydrology sources. A water table intersects the slope and seeps down the slope in some areas. Two ditches draining to the depressional portion of the wetland contribute secondary hydrologic inputs to the lowest portion of the wetland. Wetland lacks a surface outlet.		
Rationale for Delineation	Depressional and slope wetland with hydric soils, supports hydrophytic vegetation, and wetland hydrology. Hydrology and soils helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-12 is Category II.		
Wetland Functions Summary			
Water Quality	High potential to trap sediments in vegetated closed depressional topographic area impounding water and allowing fine sediments to settle out of the water column; low opportunity because stormwater from upland forested areas enters the wetland and is not carrying significant amounts of sediment. High potential to trap nutrients and toxicants in closed depression with some organic matter in the soil; low opportunity because stormwater inputs are from forested upland areas not likely carrying nutrients and toxicants.		
Hydrologic	High potential to alter flood flow due to closed depression at bottom of slope able to retain surface water during and following precipitation events; opportunity is high as water sheet flows off upland forested areas during and after storms. Erosion control and shoreline stabilization functions not provided because wetland lacks hydrologic surface connection with a stream.		
Habitat	High habitat quality due to habitat connectivity with other forested uplands and wetlands. Good canopy stratification and variable water regimen throughout the growing season provide habitat for passerine birds, small mammals, amphibians, and deer.		
Buffer Condition	Buffer function is moderate for the majority of the circumference of the wetland with mature forest providing shade and organic matter inputs. Wildlife habitat is limited due to a large right-of-way (ROW) fence which bisects the wetland and buffer, fragmenting the habitat along the current WSDOT ROW from other forested areas. Western hemlock, red alder, and black cottonwood dominate the over story with salmonberry, vine maple, and twinberry honeysuckle in the shrub layer. The wetland is up-slope from I-90 and does not receive polluted stormwater or have other sources of poor water quality inputs.		

Table 11. Wetland LC-13 Summary

WETLAND LC-13 – INFORMATION SUMMARY			
Location:	NE quadrant of I-90/SR 18 intersection, north of eastbound I-90 off-ramp at Exit 25		
	Delineation/Verification Date	September 24, 2012/2018	
	Local Jurisdiction	King County	
	WRIA	7 Snohomish	
	Ecology (2014)	III	
	King Co. Buffer Width	150 feet	
	Wetland Size	0.04 acre	
	Cowardin Classification	PSS	
	HGM Classification	slope	
	Wetland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W15-SP1	
	Upland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W15-SP2	
Dominant Vegetation	Trees – none. Sapling/shrubs – hardhack, Scouler's willow (<i>Salix scouleriana</i>), Cascara buckthorn. Herbaceous – soft rush, spike bentgrass, red fescue (<i>Festuca rubra</i>), sedges.		
Soils	A depleted matrix of 2.5Y 5/1 with concentrations is present from 0 to 6 inches. A gravel hardpan restrictive layer present at 6 inches below the surface. Indicator Depleted Matrix (F3).		
Hydrology	Wetland has shallow soils above a restrictive layer which perch water during the rainy season. Precipitation and run-on are the primary hydrologic inputs. Water leaves the wetland through infiltration and as sheetflow following precipitation events.		
Rationale for Delineation	Slope wetland with wetland hydrology, hydrophytic vegetation, and hydric soils. Soils helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-13 is Category III.		
Wetland Functions Summary			
Water Quality	Low potential to trap sediments due to vegetated slope with only a few small depressions; low opportunity because significant sources of sediments are not present. Moderate potential to trap nutrients and toxicants due to sloping topography with only a few vegetated depressions; low opportunity because inputs are low; I-90 is down-slope of the wetland and surrounding upland areas are forested.		
Hydrologic	Low potential to alter flood flow due to small size of wetland and sloping topography with an un-constricted outlet and few depressions; opportunity is low due to forested upland areas not contributing significant amounts of runoff. Erosion control and shoreline stabilization functions not provided because wetland lacks hydrologic surface connection with a stream.		
Habitat	Moderate habitat quality due to forested buffers and connection to other wetlands. Habitat connectivity limited because wetland is in ROW between I-90 and ROW fence. Wetland provides habitat for passerine birds and small mammals.		
Buffer Condition	Buffer function is moderate for the majority of the circumference of the wetland with mature forest providing shade and organic matter inputs. Wildlife habitat is limited due to a large ROW fence which fragments the habitat along the current WSDOT ROW from other forested areas. Black cottonwood and Douglas-fir dominate the over story with hardhack in the shrub layer. The wetland is up-slope from I-90 and does not receive stormwater or have other sources of poor water quality inputs.		

Table 12. Wetland LC-14 Summary

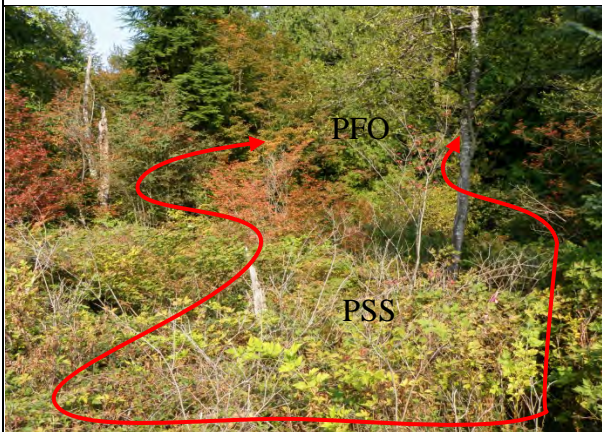

WETLAND LC-14 – INFORMATION SUMMARY			
Location:		NE quadrant of I-90/SR 18 intersection, north of eastbound I-90, east of Exit 25 off-ramp	
	Delineation/Verification Date		September 24, 2012/2018
	Local Jurisdiction		King County
	WRIA		7 Snohomish
	Ecology (2014)		III
	King Co. Buffer Width		150 feet
	Wetland Size		0.11 acre
	Cowardin Classification		PFO/PSS
	HGM Classification		Slope
	Wetland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W17-SP1, W17-SP3
	Upland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W17-SP2, W17-SP4
Dominant Vegetation	Trees – western red cedar. Sapling/shrubs – hardhack and salmonberry. Herbaceous – common ladyfern, giant horsetail.		
Soils	Soils were dark 10YR 2/1 from 0 to 8 inches. The matrix from 8 to 12 inches was 10YR3/2 with concentrations. Indicator Redox Dark Surface (F6). In other areas soils meet Indicator Loamy Mucky Mineral (F1)		
Hydrology	Slope wetland situated in a forested drainage above and to the north of I-90 which receives surface and subsurface run-on as the dominant hydrology source. A water table intersects the slope and seeps down the slope in some areas. A water conveyance structure is located at the lowest point in the wetland at toe of slope of the I-90 roadway structure, allowing surface water to leave the wetland through this constricted outlet.		
Rationale for Delineation	Slope wetland with wetland hydrology, hydrophytic vegetation, and hydric soils. Soils and vegetation helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-14 is Category III.		
Wetland Functions Summary			
Water Quality	Moderate potential to trap sediments due to sloping topography with dense herbaceous vegetation and small depressional areas; low opportunity because significant sources of sediments are not present. Moderate potential to trap nutrients and toxicants due to sloping topography with dense herbaceous vegetation and small depressional areas; low opportunity because inputs are low; I-90 is down-slope of the wetland and surrounding upland areas are forested.		
Hydrologic	Low potential to alter flood flow due to small size of wetland and sloping topography with few depressions and a constricted outlet through a culvert; opportunity is low due to forested upland areas not contributing significant amounts runoff. Erosion control and shoreline stabilization functions not provided because wetland lacks hydrologic surface connection with a stream.		
Habitat	Moderate habitat quality due to forested buffers and connection to other wetlands. Habitat connectivity limited because wetland is in ROW between I-90 and ROW fence. Wetland provides habitat for passerine birds, small mammals, and possibly amphibians.		
Buffer Condition	Buffer function is moderate for the majority of the circumference of the wetland with mature forest providing shade and organic matter inputs. Wildlife habitat is limited due to the tall ROW fence which bisects the wetland and buffer, fragmenting the habitat along the current WSDOT ROW from other forested areas. Sitka spruce, black cottonwood, Douglas-fir, and red alder dominate the over story with salmonberry, vine maple, and devil’s club in the shrub layer. The wetland is up-slope from I-90 and does not receive stormwater or have other sources of poor water quality inputs.		

Table 13. Wetland LC-15 Summary

WETLAND LC-15 – INFORMATION SUMMARY			
Location:	NE quadrant of I-90/SR 18 intersection, north of eastbound I-90, east of Exit 25 off-ramp		
	Delineation/Verification Date		September 24, 2012/2018
	Local Jurisdiction		King County
	WRIA		7 Snohomish
	Ecology (2014)		IV
	King Co. Buffer Width		50 feet
	Wetland Size		0.05 acre
	Cowardin Classification		PFO/PSS
	HGM Classification		Slope
	Wetland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W19-SP1
	Upland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W19-SP2
Dominant Vegetation	Trees – none. Sapling/shrubs – salmonberry. Herbaceous - youth on age, common ladyfern, sedges.		
Soils	Soils from 0 to 10 inches were 10YR 2/1 with concentrations. A layer from 10 to 23 inches was 10YR 4/1 with concentrations and depletions. High organic content in this loamy mucky mineral soil. Indicators Depleted Below Dark Surface (A11), Loamy Mucky Mineral (F1), Depleted Matrix (F3), and Redox Dark Surface (F6).		
Hydrology	Slope wetland in a forested drainage above and north of I-90 with a high water table and surface and subsurface run-on as the dominant hydrology sources. A water table intersects the slope and seeps down the slope in some areas. A catch basin is present on the lowest end of the wetland draining surface water from the lowest part of the wetland as well as other adjacent areas.		
Rationale for Delineation	Slope wetland with hydric soils, supports hydrophytic vegetation, and wetland hydrology. All three factors helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-15 is Category IV.		
Wetland Functions Summary			
Water Quality	Low potential to trap sediments due to steep vegetated slope lacking depressions; low opportunity because significant sources of sediments are not present. Low potential to trap nutrients and toxicants due to steep vegetated slope lacking depressions; low opportunity because inputs are low; I-90 is down-slope of the wetland and surrounding upland areas are forested.		
Hydrologic	Low potential to alter flood flow due to sloping topography lacking depressions and a constricted outlet through a culvert/French drain; opportunity is low due to forested upland areas not contributing significant amounts runoff. Erosion control and shoreline stabilization functions not provided because wetland lacks hydrologic surface connection with a stream.		
Habitat	Moderate habitat quality due to forested buffers and connection to other wetlands. Habitat connectivity limited due to ROW fence bisecting the wetland and buffer. Wetland provides habitat for passerine birds, small mammals, and deer.		
Buffer Condition	Buffer function is moderate for the majority of the circumference of the wetland with mature forest providing shade and organic matter inputs. Wildlife habitat is limited due to a large ROW fence which bisects the wetland and buffer, fragmenting the habitat along the current WSDOT ROW from other forested areas. Bigleaf maple, vine maple, red alder, and western red cedar dominate the over story with salmonberry in the shrub layer. The wetland is up-slope from I-90 and does not receive stormwater or have other sources of poor water quality inputs.		

Table 14. Wetland LC-16 Summary

WETLAND LC-16 – INFORMATION SUMMARY			
Location:		NE quadrant of I-90/SR 18 intersection, north of eastbound I-90, east of Exit 25 off-ramp	
		Delineation/Verification Date	September 24, 2012/2018
		Local Jurisdiction	King County
		WRIA	7 Snohomish
		Ecology (2014)	III
		King Co. Buffer Width	80 feet
		Wetland Size	0.14 acre
		Cowardin Classification	PSS/PEM
		HGM Classification	Slope
		Wetland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W18-SP1
		Upland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W18-SP2
Dominant Vegetation	Trees and Shrubs – none. Herbaceous – giant horsetail, common velvetgrass, red fescue.		
Soils	Soils from 0 to > 12 inches were 10YR 3/2 with concentrations and depletions. Indicator Redox Dark Surface (F6) and Depleted Dark Surface (F7).		
Hydrology	A water table intersecting the slope and then saturating the slope below is the primary source of hydrology. Surface and subsurface run-on during and following precipitation events provide secondary hydrologic inputs. Water leaves the wetland as sheetflow into the roadside ditch at the toe of slope.		
Rationale for Delineation	Slope wetland with wetland hydrology, hydrophytic vegetation, and hydric soils. Soils and vegetation helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-16 is Category IV.		
Wetland Functions Summary			
Water Quality	Low potential to trap sediments due to steep vegetated slope lacking depressions; low opportunity because significant sources of sediments are not present. Low potential to trap nutrients and toxicants due to due to steep vegetated slope lacking depressions; low opportunity because inputs are low; I-90 is down-slope of the wetland and surrounding upland areas are forested.		
Hydrologic	Flood flow alteration functions not provided due to steep slopes without woody vegetation; opportunity is low due to forested upland areas not contributing significant amounts runoff. Erosion control and shoreline stabilization functions not provided because wetland lacks hydrologic surface connection with a stream.		
Habitat	Low habitat quality due to cutslope wetland in ROW between I-90 and ROW fence. Wetland provides minimal habitat for passerine birds and small mammals.		
Buffer Condition	Buffer function is limited for the majority of the circumference of the wetland. The wetland is bordered by the I-90 road prism to the south and by a tall ROW fence to the north. Stormwater from I-90 flows directly into a small portion of the wetland, and the fence creates habitat fragmentation. Some deciduous trees and shrubs are directly adjacent to the wetland and may provide limited buffering functions.		

Table 15. Wetland LC-17 Summary

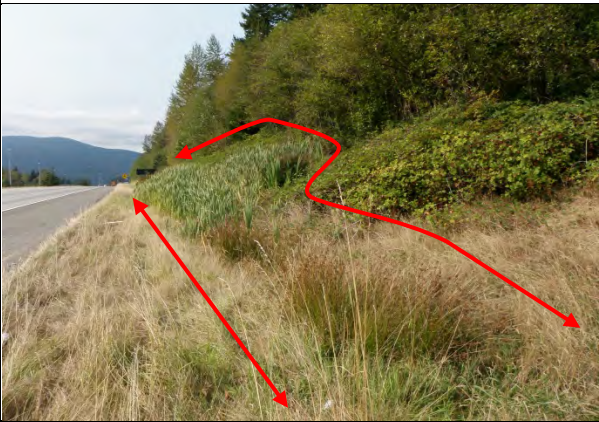

WETLAND LC-17 – INFORMATION SUMMARY			
Location:	NE quadrant of I-90/SR 18 intersection, north of eastbound I-90, east of Exit 25 off-ramp		
	Delineation/Verification Date	September 24, 2012/2018	
	Local Jurisdiction	King County	
	WRIA	7 Snohomish	
	Ecology (2014)	III	
	King Co. Buffer Width	80 feet	
	Wetland Size	0.22 acre	
	Cowardin Classification	PSS/PEM	
	HGM Classification	Slope	
	Wetland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W20-SP1	
Upland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W20-SP2		
Dominant Vegetation	Trees and shrubs – none. Herbaceous – broadleaf cattail (<i>Typha latifolia</i>), sawbeak sedge (<i>Carex stipata</i>), common velvetgrass, soft rush, red fescue, quackgrass (<i>Elymus repens</i>).		
Soils	Soils from 0 to >12 inches were 10YR 2/1 with concentrations. Indicator Redox Dark Surface (F6).		
Hydrology	A water table intersecting the slope and then saturating the slope below is the primary source of hydrology. Surface and subsurface run-on during and following precipitation events provide secondary hydrologic inputs. Water leaves the wetland as sheetflow into the roadside ditch at the toe of slope.		
Rationale for Delineation	Slope wetland with wetland hydrology, hydrophytic vegetation, and hydric soils. Soils and vegetation helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-17 is Category III.		
Wetland Functions Summary			
Water Quality	Moderate potential to trap sediments due to sloping topography with dense herbaceous vegetation with small depressions; low opportunity because significant sources of sediments are not present. Moderate potential to trap nutrients and toxicants due to sloping topography with dense herbaceous vegetation and small depressional areas; low opportunity because inputs are low; stormwater from I-90 only enters the lowest portion of the wetland that is ditched at the toe of slope of the I-90 roadway structure.		
Hydrologic	Low potential to alter flood flow due to sloping topography with an unconstricted outlet and few depressions; opportunity is low due to forested upland areas not contributing significant amounts runoff. Erosion control and shoreline stabilization functions not provided because wetland lacks hydrologic surface connection with a stream.		
Habitat	Moderate habitat quality due to forested buffers and connection to other wetlands. Habitat connectivity limited due to ROW fence. Wetland provides habitat for passerine birds and small mammals.		
Buffer Condition	Buffer function is limited for the majority of the circumference of the wetland. The wetland is bordered by the I-90 road prism to the south and by a tall ROW fence to the north. Stormwater from I-90 flows directly into a small portion of the wetland, and the fence creates habitat fragmentation. Upland grasses and Himalayan blackberry are present on the northern wetland boundary and may provide limited buffering functions.		

Table 16. Wetland LC-18 Summary

WETLAND LC-18 – INFORMATION SUMMARY			
Location:	SE quadrant of I-90/SR 18 intersection, between SE 104th St and eastbound I-90 on-ramp		
	Delineation/Verification Date		October 31, 2011/2018
	Local Jurisdiction		King County
	WRIA		7 Snohomish
	Ecology (2014)		III
	King Co. Buffer Width		150 feet
	Wetland Size		0.11 acre
	Cowardin Classification		PFO
	HGM Classification		Slope
	Wetland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W12-SP1
	Upland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W12-SP2
Dominant Vegetation	Trees – western red cedar, red alder, vine maple. Sapling/shrubs – salmonberry, twinberry honeysuckle (<i>Lonicera involucrata</i>). Herbaceous – American skunk-cabbage, western swordfern on hummocks.		
Soils	Soil matrices of 10YR 4/2 with concentrations and depletions to greater than 16 inches. Indicator Depleted Matrix (F3).		
Hydrology	Wetland situated on a forested slope below and south of I-90 with a water table intercepting a slope; creating a seep. Inundation present in the flatter areas or in small depressions on the slope. Precipitation and stormwater runoff from I-90 contribute secondary hydrologic inputs. Surface water leaves the wetland and flows into the upper portion of LC-19 near the ROW fence.		
Rationale for Delineation	Slope wetland with hydric soils, supports hydrophytic vegetation, and wetland hydrology. Obvious change in vegetation community and wetland hydrology indicators helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-18 is Category III.		
Wetland Functions Summary			
Water Quality	High potential to trap sediments due to vegetated surface depressions; high opportunity because significant sources of stormwater enter and flow through the wetland. High potential to trap nutrients and toxicants due to sloping vegetated depressions and soils with high organic matter content; high opportunity because stormwater from I-90 flows through the wetland.		
Hydrologic	Moderate potential to alter flood flow due to densely vegetated areas with depressions; opportunity is moderate as stormwater runoff from I-90 drains through the wetland and wetland occurs high in watershed. Erosion control and shoreline stabilization functions not provided because wetland lacks hydrologic surface connection with a stream.		
Habitat	Low habitat quality due to extremely limited habitat connectivity, as wetland is confined on one side by I-90 and the ROW fence on the other. Function also limited by high stormwater inputs. Provides limited habitat for passerine birds, small mammals, and amphibians.		
Buffer Condition	Buffer function is moderate. Wildlife habitat is limited due to a large ROW fence which bisects the buffer, fragmenting the habitat along the current WSDOT ROW from other forested areas. Western red cedar, Sitka spruce (<i>Picea sitchensis</i>), and red alder dominate the over story with salmonberry and vine maple in the shrub layer. The wetland is down-slope from I-90 and may receive stormwater or have other sources of poor water quality inputs.		

Table 17. Wetland LC-19 Summary

WETLAND LC-19 – INFORMATION SUMMARY			
Location:	SE quadrant of I-90/SR 18 intersection, between SE 104th St and eastbound I-90 on-ramp		
		Delineation/Verification Date	October 3, 2012/2018
		Local Jurisdiction	King County
		WRIA	7 Snohomish
		Ecology (2014)	II
		King Co. Buffer Width	150 feet
		Wetland Size	0.35 acre
		Cowardin Classification	PFO
		HGM Classification	Depressional
		Wetland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W11-SP1
		Upland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W10-SP2 & W11-SP2
Dominant Vegetation	Trees – black cottonwood. Sapling/shrubs – black cottonwood, hardhack, western red cedar. Herbaceous – soft rush, spike bentgrass, tapertip rush,common selfheal (<i>Prunella vulgaris</i>).		
Soils	Soil to 4 inches was a depleted matrix of 10YR 4/1 with concentrations. A restrictive layer of gravels present at 4 inches. Indicator Depleted Matrix (F3).		
Hydrology	Wetland has depressional areas able to impound surface water. Previous land use activities appear to have compacted soils and cleared/disturbed vegetation. Precipitation and surface run-on from up-slope areas perches on compacted soils in a ditched area with depressions along SE 104th St where water ponds for long periods. This ditch drains through a stormwater conveyance and ultimately to Stream LC-G.		
Rationale for Delineation	Depressional wetland with hydric soils, supports hydrophytic vegetation, and wetland hydrology. Obvious change in vegetation community and hydric soils helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-19 is Category II.		
Wetland Functions Summary			
Water Quality	High potential to trap sediments due to depressions and densely established herbaceous and woody vegetation; high opportunity because significant sources of stormwater sheet flow and channel flow through the wetland. High potential to trap nutrients and toxicants due to depressions with dense herbaceous vegetation; high opportunity because wetland receives stormwater runoff from I-90 and an up-slope wetland that also receives runoff from I-90.		
Hydrologic	Moderate potential to alter flood flow due to ability to slow small amounts of water as it drains through vegetated areas with variable topography; opportunity is high as significant amounts of water flow through the wetland, then through LC-20, and on to LC-G during and following precipitation events. Low potential to reduce erosion and stabilize banks. Wetland drains to LC-G through a ditch, which has some ability to reduce erosion and stabilize banks.		
Habitat	Moderate habitat quality due to forested plant community with other vegetation strata below and seasonal inundation. Habitat for passerine birds, small mammals, and amphibians.		
Buffer Condition	Buffer function is high for the majority of the circumference of the wetland. The buffer is a previously disturbed area that has a mixed stand of red alder and black cottonwood with Douglas-fir, western red cedar, and hardhack in the understory. An old abandoned temporary access road borders the west side of the wetland and SE 104th St boards the southern boundary. The up-slope buffer areas provide hydrologic functions. Poor water quality in-puts enter wetland. The buffer provides wildlife habitat functions.		

Table 18. Wetland LC-20 Summary

WETLAND LC-20 – INFORMATION SUMMARY			
Location:	SE quadrant of I-90/SR 18 intersection, between SE 104th St and eastbound I-90 on-ramp		
	Delineation/Verification Date	October 3, 2012/2018	
	Local Jurisdiction	King County	
	WRIA	7 Snohomish	
	Ecology (2014)	II	
	King Co. Buffer Width	150 feet	
	Wetland Size	0.90 acre	
	Cowardin Classification	PFO	
	HGM Classification	Slope	
	Wetland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W10-SP1	
	Upland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W10-SP2 & W11-SP2	
Dominant Vegetation	Trees – black cottonwood. Sapling/shrubs – hardhack, western red cedar. Herbaceous – soft rush, spike bentgrass, sedges.		
Soils	Soil to 6 inches was a depleted matrix of 10YR 3/1 with concentrations. A restrictive layer of gravels present at 6 inches. Indicator Depleted Matrix (F3).		
Hydrology	Wetland situated on a slope with some depressional areas able to impound surface water. Previous land use activities appear to have compacted soils and cleared/disturbed vegetation. Precipitation and surface run-on from up-slope areas perches on compacted soils in sloping areas and runs down-slope to a ditch along SE 104th St. This ditch drains surface water leaving the wetland to LC-G.		
Rationale for Delineation	Slope wetland with hydric soils, supports hydrophytic vegetation, and wetland hydrology. Obvious change in vegetation community and hydric soils helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-20 is Category II.		
Wetland Functions Summary			
Water Quality	High potential to trap sediments due to sloping topography with depressions and densely established herbaceous and woody vegetation; high opportunity because significant sources of stormwater sheet flow and channel flow through the wetland. High potential to trap nutrients and toxicants due to depressions with dense herbaceous vegetation; high opportunity because wetland receives stormwater runoff from I-90 and up-slope wetlands that also receive runoff from I-90.		
Hydrologic	Moderate potential to alter flood flow due to ability to slow small amounts of water as it drains through vegetated areas with variable topography; opportunity is high as significant amounts of water flow through the wetland and then into LC-G during and following precipitation events. Low potential to reduce erosion and stabilize banks. Wetland drains to LC-G through a ditch which has some ability to reduce erosion and stabilize banks.		
Habitat	Moderate habitat quality due to forested plant community with other vegetation strata below and seasonal inundation. Habitat for passerine birds, small mammals, and amphibians.		
Buffer Condition	Buffer function is high for the circumference of the wetland. The buffer is in a previously disturbed area that has a mixed stand of red alder and black cottonwood with Douglas-fir, western red cedar, and hardhack in the understory. An old abandoned temporary access road borders the east side of the wetland. The up-slope buffer areas provide hydrologic functions. Poor water quality in-puts enter wetland. Wildlife habitat is limited due to a large ROW fence which bisects the wetland and buffer, fragmenting the forested habitat along the current WSDOT ROW from other forested areas.		

Table 19. Wetland LC-21 Summary

WETLAND LC-21 – INFORMATION SUMMARY			
Location:	SE quadrant of I-90/SR 18 intersection, between SE 104th St and eastbound I-90 on-ramp		
	Delineation/Verification Date		November 19, 2012/2018
	Local Jurisdiction		King County
	WRIA		7 Snohomish
	Ecology (2014) Rating		III
	King Co. Buffer Width		150 feet
	Wetland Size		0.03 acre
	Cowardin Classification		PFO/PSS
	HGM Classification		Depressional
	Wetland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W9-SP1
Upland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W9-SP2	
Dominant Vegetation	Trees – none. Sapling/shrubs – salmonberry, hardhack, twinberry honeysuckle, western red cedar. Herbaceous – creeping buttercup (<i>Ranunculus repens</i>), trailing blackberry.		
Soils	Hydric soils are present in this wetland. Soils were too wet to observe during the 2012 field visit due to heavy rains. Soils meet the definition of a hydric soil: soils that are saturated or ponded for long periods during the growing season.		
Hydrology	A high water table is the primary source of hydrology in this wetland. Surface and subsurface run-on during and following precipitation events provide secondary hydrologic inputs. A ditch conveying runoff from up-slope wetlands (LC18-20) and run-on from precipitation events parallels the I-90 on-ramp at toe of slope and flows through this wetland. This ditch runs through LC-21 and ultimately drains to LC-G.		
Rationale for Delineation	Depressional wetland with wetland hydrology, hydrophytic vegetation, and hydric soils. Vegetation, hydrology, and topography helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-21 is a Category III.		
Wetland Functions Summary			
Water Quality	The wetland ponds (less than 0.5 feet) and has an intermittently flowing outlet, which provides the potential to trap sediments. In addition, the wetland has the potential to improve water quality given the location down-slope from I-90 and other wetlands that also contribute hydrology to this wetland. Moderate potential to trap nutrients and toxicants due to dense vegetation; moderate opportunity because wetland is downslope from I-90 and other wetlands in similar landscape position below I-90, that contribute surface flows through this wetland.		
Hydrologic	Moderate potential to alter flood flow due to the low depth of storage during wet periods. The wetland opportunity is moderate because wetland receives hydrology from up-slope wetlands, uplands, and stormwater from I-90, which eventually drains to LC-G. Erosion control and shoreline stabilization functions provided at a low level. Wetland is not directly connected to streambank; however, it drains to a ditch that drains to LC-G.		
Habitat	Low habitat quality due to tall ROW fence directly adjacent to wetland, cutting off connection with upland buffer areas. Fence limits wildlife connectivity. Small size of wetland also limits habitat functions. Minimal habitat for passerine birds, small mammals, and aquatic invertebrates.		
Buffer Condition	Buffer function is moderate. Wildlife habitat is limited due to a large ROW fence which bisects the buffer, fragmenting the habitat along the current WSDOT ROW from other forested areas. Western red cedar and Douglas-fir dominate the over story with salal dominating in the shrub layer. The wetland is down-slope from I-90 and likely receives stormwater or other sources of poor water quality inputs.		

Table 20. Wetland LC-22 Summary

WETLAND LC-22 – INFORMATION SUMMARY			
Location:		SE quadrant of I-90/SR 18 intersection, between SE 104th St and eastbound I-90 on-ramp	
	Delineation/Verification Date		November 19, 2012/2018
	Local Jurisdiction		King County
	WRIA		7 Snohomish
	Ecology (2014) Rating		II
	King Co./USFS Buffer Width		150 feet/100 feet
	Wetland Size		0.07 acre
	Cowardin Classification		PFO/PSS
	HGM Classification		Depressional
	Wetland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W8-SP1
	Upland Data Sheets		WSDOT 2013 Appendix C; Sampling Point W8-SP2
Dominant Vegetation	Trees – Black cottonwood, red alder. Sapling/shrubs – redosier dogwood (<i>Cornus alba</i>), Pacific ninebark. Herbaceous – reed canarygrass (<i>Phalaris arundinacea</i>), trailing blackberry (<i>Rubus ursinus</i>).		
Soils	Hydric soils are present in this wetland. Soils were too wet to observe during the 2012 field visit due to heavy rains. Matrix colors of 10YR 4/2 with redox observed. Soils meet the definition of a hydric soil: soils that are saturated or ponded for long periods during the growing season.		
Hydrology	A high water table is the dominant hydrology source. Precipitation and runoff from SE 104th St contribute secondary inputs. Surface water leaves the wetland through a culvert, draining to LC-G.		
Rationale for Delineation	Depressional wetland with hydric soils, supports hydrophytic vegetation, and wetland hydrology. Obvious change in vegetation community, hydrology, and topography helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-22 is Category II.		
Wetland Functions Summary			
Water Quality	Moderate potential to trap sediments due to depressional topography with long periods of ponding and a highly constricted outlet (a culvert), allowing water to move through system relatively slowly and fine sediments to settle out of the water column; moderate opportunity from upland areas and roadside runoff. High potential to trap nutrients and toxicants due to depressional topography with a constricted outlet that ponds greater than 2 feet of water for long periods; high opportunity because stormwater runoff from SE 104th St drains directly to wetland.		
Hydrologic	High potential to alter flood flow due to depression with highly constricted outlet and ability to impound significant amounts of surface water for long periods; opportunity is high due to run-on from up-slope forested areas and stormwater from adjacent street. Erosion control and shoreline stabilization functions not provided because wetland lacks hydrologic surface connection with a stream.		
Habitat	Moderate habitat quality due to connectivity with forested uplands, other wetlands, and streams. Wetland provides minimal habitat for passerine birds and small mammals.		
Buffer Condition	Buffer function is moderate for half of the circumference of the wetland. Wildlife habitat is limited due to a large right-of-way (ROW) fence which bisects the buffer, fragmenting the habitat along the current WSDOT ROW from other forested areas. Western red cedar and Douglas-fir dominate the over story with salal (<i>Gaultheria shallon</i>) and vine maple dominating the shrub layer. The wetland receives stormwater from SE 104th St. The south side does not have a functioning or regulated buffer. It is a mowed and maintained strip of road ROW along SE 104th St.		

Table 21. Wetland LC-23 Summary

WETLAND LC-23 – INFORMATION SUMMARY			
Location:		Southeast of the SR 18 and I-90 onramp intersection.	
	Delineation Date		October 24, 2018
	Local Jurisdiction		King County
	WRIA		7 Snohomish
	Ecology (2014) Rating		III
	King Co. Buffer Width		80 feet
	Wetland Size (sf/acres)		2,352/0.054 acre
	Cowardin Classification		PSS/PEM
	HGM Classification		Slope
	Wetland Data Sheet(s)		Sampling Point W42-SP1
	Upland Data Sheet(s)		Sampling Point W42-SP2
Dominant Vegetation	Trees- none. Sapling/shrubs - hardhack (<i>Spiraea douglasii</i>), red alder (<i>Alnus rubra</i>). Herbaceous - sweet vernalgrass (<i>Anthoxanthum odoratum</i>), western Canada goldenrod (<i>Solidago lepida</i>), soft rush (<i>Juncus effusus</i>).		
Soils	Soils examined to a depth of 11 inches exhibited hydric characteristics. Dark 10YR 3/2 soils from 0 to 5 inches. Depleted matrix of 2.5Y 5/1 with concentrations present from 5 to 11 inches underlain by a restrictive layer of cobbles and gravel. Indicators Depleted Below Dark Surface (A11) and Depleted Matrix (F3) met.		
Hydrology	Precipitation and stormwater sheet flow on top of a restrictive layer appear to be the main sources of hydrology. Water leaves the wetland through a roadside ditch and out a culvert flowing east under the I-90 onramp.		
Rationale for Delineation	Positive indicators of all three wetland criteria are present. Placement of boundary determined by vegetation and soils.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-23 is Category III.		
Wetland Functions Summary			
Water Quality	Low potential for production of organic matter and its export due to >90% cover of dense herbaceous vegetation across the wetland. Presence of deciduous plants increase plant matter and provide additional strata. A surface water outlet to a roadside ditch has the potential to readily export organic material to down-gradient habitats. Diversity and interspersions of vegetation is low.		
Hydrologic	No potential to alter flood flow or provide sediment removal due to small size and sloping topography. Erosion control and shoreline stabilization not provided because wetland is not associated with a water course or shoreline.		
Habitat	No potential to provide habitat functions. Two Cowardin Class are present, but interspersions in low, there is fragmentation by development, and low diversity of plant species.		
Buffer Condition	Buffer function is limited. The wetland is bordered by SR 18 to the west and onramps for I-90 to the north and southeast.		

Table 22. Wetland LC-24 Summary

WETLAND LC-24 – INFORMATION SUMMARY			
Location:		East of SR 18 at approximately mileposts 27.6-27.8. Immediately south of the I-90 westbound on-ramp to SR 18.	
		Delineation Date	July 30, 2019
		Local Jurisdiction	King County
		WRIA	7 Snohomish
		Ecology (2014) Rating	I
		King Co. Buffer Width	300 feet
		Wetland Size	26.5 acres
		Cowardin Classification	PEM/PFO/PSS
		HGM Classification	Riverine/ Depressional
		Wetland Data Sheet(s)	Sampling Point W51-SP2, W51-SP4, W51-SP6
Upland Data Sheet(s)	Sampling Point W51-SP1, W51-SP3, W51-SP5		
Dominant Vegetation	Trees- Western hemlock (<i>Tsuga heterophylla</i>), Pacific willow (<i>Salix lasiandra</i>), black cottonwood, red alder, and western red cedar. Sapling/shrubs - Pacific ninebark, salmonberry, and yellow skunk-cabbage (<i>Lysichiton americanus</i>). Herbaceous- Yellow skunk-cabbage and western red lady-fern, and Herb Robert (<i>Geranium robertianum</i>) (1% cover).		
Soils	Soils examined to a depth of 15 inches exhibited hydric characteristics. Black 10YR 2/1 soils from 0 to 15 inches. Concentrations present from 0-15 inches (10YR 5/6). Indicator Redox Dark Surface (F6) was met. In other areas soils meet indicator Depleted Matrix (F3) and Loamy Gleyed Matrix (F2).		
Hydrology	The main sources of hydrology include overbank flooding from Lake Creek and its unnamed tributary, as well as sheetflow from adjacent impervious surfaces and upland areas. Water outlets through Lake Creek to the southwest. Soils were saturated to the surface at the time of the delineation in most locations, and at some locations a high water table and surface water were present.		
Rationale for Delineation	Positive indicators of hydrology, hydrophytic vegetation and hydric soils present. Placement of boundary determined by vegetation and soils, as well as Lidar and topographic data.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-24 is Category I.		
Wetland Functions Summary			
Water Quality	High potential for production of organic matter and production of its export due to the Lake Creek outlet. Diversity and interspersions of vegetation is moderate to high.		
Hydrologic	High potential to alter flood flow or provide sediment removal due stormwater inputs. Erosion control and shoreline stabilization provided because wetland is associated with a water course (Lake Creek).		
Habitat	High potential to provide habitat functions due to moderate to high diversity of plant species, three Cowardin Classes present, permanent inundation, and permanently ponded depressions and a stream present.		
Buffer Condition	Buffer function is moderate. The wetland is bordered by upland forest to the east but is 15-150 feet away from moderately used rural roads within the 300 foot buffer.		

Table 23. Wetland LC-25 Summary

WETLAND LC-25 – INFORMATION SUMMARY			
Location:	SE quadrant of I-90/SR 18 intersection, between SE 104th St and eastbound I-90 on-ramp		
	Delineation/Verification Date	October 22, 2012/2018	
	Local Jurisdiction	King County	
	WRIA	7 Snohomish	
	Ecology (2014) Rating	III	
	King Co. Buffer Width	150 feet	
	Wetland Size	0.05 acre	
	Cowardin Classification	PFO/PSS	
	HGM Classification	Depressional	
	Wetland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W6-SP1	
	Upland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W6-SP2	
Dominant Vegetation	Trees – none. Sapling/shrubs – red alder, salmonberry, Himalayan blackberry (<i>Rubus armeniacus</i>). Herbaceous – soft rush, sedges.		
Soils	Soil to 16 inches had a depleted matrix of 10YR 4/2 with concentrations. Indicator Depleted Matrix (F3).		
Hydrology	Wetland situated on a slope surrounded by an old temporary access road. Water perches on disturbed/compacted soils. Hydrology is mainly precipitation driven with surface run-on from up-slope areas. Water leaves the wetland as sheet flow flowing down old road and into LC-26.		
Rationale for Delineation	Slope wetland with hydric soils, supports hydrophytic vegetation, and wetland hydrology. Obvious change in vegetation community and wetland hydrology indicators helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-25 is Category III.		
Wetland Functions Summary			
Water Quality	Moderate potential to trap sediments due to sloping topography with dense herbaceous vegetation; moderate opportunity because wetland receives surface water runoff. Moderate potential to trap nutrients and toxicants due to sloping topography with small depressions and herbaceous vegetation; moderate opportunity because wetland receives surface water runoff.		
Hydrologic	Moderate potential to alter flood flow due to gentle sloping topography with dense woody and herbaceous vegetation; moderate opportunity due to surface water run-on. Erosion control and shoreline stabilization functions not provided because wetland lacks hydrologic surface connection with a stream.		
Habitat	Moderate habitat quality due to wetland area with herbaceous vegetation and shrubs and seasonal shallow surface ponding. Buffer connects forested uplands, other wetlands, and a stream. Wetland provides habitat for passerine birds and small mammals.		
Buffer Condition	Buffer function is high for the entire circumference of the wetland. The buffer is a combination of black cottonwood forest with shrubby understory and previously disturbed areas that have red alder and black cottonwood saplings establishing. These areas also include an old abandoned temporary access road. The upslope buffer areas provide hydrologic functions. The buffer provides wildlife habitat functions.		

Table 24. Wetland LC-26 Summary

WETLAND LC-26 – INFORMATION SUMMARY			
Location:		SE quadrant of I-90/SR 18 intersection, between SE 104th St and eastbound I-90 on-ramp	
		Delineation/Verification Date	October 22, 2012/2018
		Local Jurisdiction	King County
		WRIA	7 Snohomish
		Ecology (2014) Rating	III
		King Co. Buffer Width	150 feet
		Wetland Size	0.01 acre
		Cowardin Classification	PSS/PEM
		HGM Classification	Depressional
		Wetland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W7-SP1
		Upland Data Sheets	WSDOT 2013 Appendix C; Sampling Point W7-SP2
Dominant Vegetation	Trees – none. Sapling/shrubs – hardhack, red alder, willows. Herbaceous – soft rush, eggbract sedge (<i>Carex ovalis</i>), common tansy (<i>Tanacetum vulgare</i>), spike bentgrass.		
Soils	Soil to 4 inches was a depleted matrix of 10YR 4/2 with concentrations. Restrictive layer of gravels present at inches. Indicator Depleted Matrix (F3).		
Hydrology	Wetland situated on a slope with small depressions able to impound surface water. Water perches on a compacted/disturbed soil layer on top of an old temporary access road. Hydrology is mainly precipitation driven with surface run-on from up-slope areas and LC-25.		
Rationale for Delineation	Depressional wetland with hydric soils, supports hydrophytic vegetation, and wetland hydrology. Obvious change in vegetation community and wetland hydrology indicators helped determine wetland boundary.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-26 is Category III.		
Wetland Functions Summary			
Water Quality	Moderate potential to trap sediments due to depressional topography with dense herbaceous vegetation; moderate opportunity because wetland receives surface water runoff. Moderate potential to trap nutrients and toxicants due to sloping topography with small depressions and herbaceous vegetation; moderate opportunity because wetland receives surface water runoff.		
Hydrologic	Moderate potential to alter flood flow due to gentle depressional topography with dense woody and herbaceous vegetation; moderate opportunity due to surface water run-on. Erosion control and shoreline stabilization functions not provided because wetland lacks hydrologic surface connection with a stream.		
Habitat	Moderate habitat quality due to wetland area with herbaceous vegetation and seasonal shallow surface ponding. Buffer connects forested uplands, other wetlands, and a stream. Wetland provides habitat for passerine birds and small mammals.		
Buffer Condition	Buffer function is limited for half of the circumference of the wetland. This section of buffer is bordered by SE 104th St. The other half of the buffer is a combination of black cottonwood forest with shrubby understory and previously disturbed areas that have red alder and black cottonwood saplings establishing. These areas also include an old abandoned temporary access road. The upslope buffer areas provide hydrologic and habitat functions.		

Table 25. Wetland LC-27 Summary

WETLAND LC-27 – INFORMATION SUMMARY		
Location:	Southeast of the I-90/SR 18 Interchange and to the south of Lake Creek (Figure 6; Appendix A).	
	Delineation Date	August 15, 2018
	Local Jurisdiction	King County
	WRIA	7 Snohomish
	Ecology (2014) Rating	II
	King County Buffer Width	300 feet
	Approximate Wetland Size (sf/acres)	>313,500/7.20
	Cowardin Classification	PFO/PSS/PEM
	HGM Classification	Depressional/Riverine
	Wetland Data Sheets	Appendix C; Sampling Point 10 and 20
	Upland Data Sheets	Appendix C; Sampling Point 9, 11, 21, and 22
Dominant Vegetation	Trees—Western red cedar, black cottonwood, and red alder. Sapling/shrubs —salmonberry, vine maple, twinberry honeysuckle, and willows. Herbaceous—Small-fruited bulrush, American skunk-cabbage, creeping buttercup, false lily-of-the-valley (<i>Maianthemum dilatatum</i>), Kentucky (<i>Poa protensis</i>) bluegrass, common ladyfern, fowl mannagrass, youth on age, reed canarygrass, giant horsetail, small-fruited bulrush, western swordfern, and fringe cup (<i>Tellima grandiflora</i>).	
Soils	Soils within Wetland LC-27 generally had four layers. The surface layer (0 to 3 inches) was 10YR 2/1 loam. The second layer (3 to 8 inches) was 10YR 3/1 loam. The third layer (8 to 9 inches) was 10YR 5/1 sandy loam with 10YR 5/6 concentrations. The bottom layer (9 to 16 inches) was 10YR 7/1 with 10YR 5/8 and 10YR 2/1 concentrations. These soils met the criteria for hydric soil indicators A11 (depleted below dark surface) and F3 (depleted matrix).	
Hydrology	A high water table is the primary source of hydrology for Wetland LC-27. Additional hydrologic inputs include precipitation and some overbank flooding in areas adjacent to Lake Creek (LC-A) and Stream LC-B.	
Rationale for Delineation	Depressional wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.	
Rationale for Local Rating	Wetland LC-27 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.	
Wetland Functions Summary		
Water Quality	Moderate potential to trap sediments due to seasonal ponding, densely established persistent vegetation, and a highly constricted outlet; low landscape potential due to lack of proximity to stormwater discharges and pollutant sources; high societal value because Wetland LC-27 is located within a basin with a total maximum daily load (TMDL) (Raging River basin).	
Hydrologic	Moderate site potential for slowing flood velocities due to high surface water storage capabilities (marks of ponding between 2 and 3 feet from the bottom of the outlet); Wetland LC-27 does not receive stormwater and is not within proximity to land uses generating excess runoff or pollution; therefore, landscape potential for hydrologic function is low.	
Habitat	Wetland LC-27 has high habitat quality with multiple plant communities, multiple hydroperiods, high plant diversity, and high habitat interspersion. Special features beneficial for wildlife include large downed wood, snags, and thin-stemmed vegetation for amphibian use. Also present is vegetation overhanging a seasonal stream, thus cooling water temperatures and benefitting fish.	
Buffer Condition	Wetland LC-27 buffer is limited to the west by SR 18 and is disrupted to the north by Rattlesnake Road SE. The wetland is part of a relatively undisturbed vegetated corridor and connects to other wetlands and to undisturbed uplands greater than 25 acres in size.	

Table 26. Wetland LC-28 Summary

WETLAND LC-28 – INFORMATION SUMMARY			
Location:	Southeast of the I-90/SR 18 Interchange (Figure 6; Appendix A).		
	Delineation Date	August 14, 2018	
	Local Jurisdiction	King County	
	WRIA	7 Snohomish	
	Ecology (2014) Rating	I	
	King County Buffer Width	300 feet	
	Approximate Wetland Size (sf/acres)	>402,500/9.24	
	Cowardin Classification	PFO/PSS/PEM	
	HGM Classification	Depressional	
	Wetland Data Sheets	Appendix C; Sampling Point 1, 3, and 5	
	Upland Data Sheets	Appendix C; Sampling Point 2, 4, and 6	
Dominant Vegetation	Trees—Western red cedar, red alder, black cottonwood, and Cascara buckthorn. Sapling/shrubs —salmonberry, Pacific ninebark, hardhack, and trailing blackberry. Herbaceous—common ladyfern, deer fern (<i>Blechnum spicant</i>), coastal hedgenettle (<i>Stachys chamissonis</i>), fowl mannagrass (<i>Glyceria striata</i>), and youth on age.		
Soils	Soils within Wetland LC-28 generally had three layers. The surface layer (0 to 2 inches) was 7.5YR 2.5/1 loam. The middle layer (2 to 8 inches) was 10YR 4/2 loam with 7.5YR 3/4 concentrations and 10YR 6/1 depletions. The bottom layer (8 to 19 inches) was 10YR 5/1 gravelly loam with 10YR 3/6 concentrations throughout the matrix. These soils met the criteria for hydric soil indicators A11 (depleted below dark surface) and F3 (depleted matrix).		
Hydrology	Wetland LC-28 is located within a depression with an intermittently flowing outlet (Stream LC-B). Wetland hydrology is supported by a high groundwater table, precipitation, and runoff from SR 18. Ponded water was observed throughout the dry season.		
Rationale for Delineation	Depressional wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.		
Rationale for Local Rating	Wetland LC-28 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.		
Wetland Functions Summary			
Water Quality	Moderate potential to trap sediments due to seasonal ponding, densely established persistent vegetation, and an intermittently flowing outlet; moderate potential for water quality improvement within the landscape due to reception of stormwater discharges and proximity to roadside pollutants (petroleum oil and garbage).		
Hydrologic	High potential to slow floodwater velocities due to a high storage capacity (marks of ponding are 3 feet or greater above the bottom of the outlet); moderate potential of hydrologic function within the landscape due to reception of stormwater discharges; high societal value because of surface flooding downgradient of wetland.		
Habitat	Multiple vegetation classes and hydroperiods result in high interspersions of habitats. Wetland LC-28 contains high plant diversity and various habitat features such as large downed wood, snags, thin-stemmed persistent plants, beaver use, and overhanging vegetation. With the exception of SR 18, surrounding land use is primarily moderate/low intensity or undisturbed. Four WDFW-listed Priority Habitats are present within 100 meters of Wetland LC-28: Biodiversity Areas and Corridors, Riparian, Instream, and Snags and Logs.		
Buffer Condition	The western extent of Wetland LC-28 abuts the road prism or SR 18. The buffer of Wetland LC-28 extending east is relatively undisturbed forest (previously disturbed by logging). The forest is now a mixed stand of western hemlock, western red cedar, and Douglas-fir and provides wildlife habitat functions.		

Table 27. Wetland LC-29 Summary

WETLAND LC-29 – INFORMATION SUMMARY			
Location:		West of SR 18 at approximately milepost 27.05.	
		Delineation Date	June 13, 2019
		Local Jurisdiction	King County
		WRIA	7 Snohomish
		Ecology (2014) Rating	II
		King Co. Buffer Width	150 feet
		Wetland Size	0.272 acre
		Cowardin Classification	PSS/PEM
		HGM Classification	Depressional
		Wetland Data Sheet(s)	Sampling Point W50-SP3
		Upland Data Sheet (s)	Sampling Point W50-SP1 and W50-SP2
Dominant Vegetation	Trees- Western hemlock. Sapling/shrubs - red huckleberry (1% cover). Herbaceous- Yellow skunk-cabbage, Salal, western red lady-fern, and salmonberry		
Soils	Soils examined to a depth of 20 inches exhibited hydric characteristics. Very dark brown 10YR 2/2 soils from 0 to 4 inches. Depleted matrices of 10YR 4/2 with concentrations present from 0-6 inches (7.5YR 5/8). Very dark brown (10YR 2/2) soils from 6-14 inches with depleted matrices (2.5Y 6/1) and concentrations of 7.5YR 4/6 present. Strong brown (7.5YR 4/6) soils from 14 to 20 inches with depletions (10YR 3/1) located in the matrix. Indicator Redox Dark Surface (F6) was met.		
Hydrology	Precipitation and a high groundwater appear to be the main sources of hydrology. Water does not leave the bowl-shaped wetland. Soils were saturated to the surface at the time of the delineation.		
Rationale for Delineation	Positive indicators of hydrology, hydrophytic vegetation and hydric soils present. Placement of boundary determined by vegetation and soils.		
Rationale for Local Rating	King County classifies wetlands based on the Washington State Wetland Rating System (Hruby 2014). Wetland LC-29 is Category II.		
Wetland Functions Summary			
Water Quality	High potential for production of organic matter but no production of its export due to a lack of an outlet. Diversity and interspersions of vegetation is moderate.		
Hydrologic	Moderate potential to alter flood flow or provide sediment removal due to stormwater inputs. Erosion control and shoreline stabilization not provided because wetland is not associated with a water course or shoreline.		
Habitat	Moderate potential to provide habitat functions due to fragmentation by development, moderate diversity of plant species, two Cowardin Classes present, and seasonal inundation.		
Buffer Condition	Buffer function is high. The wetland is bordered by undisturbed upland forest in all directions of the 150 foot buffer.		

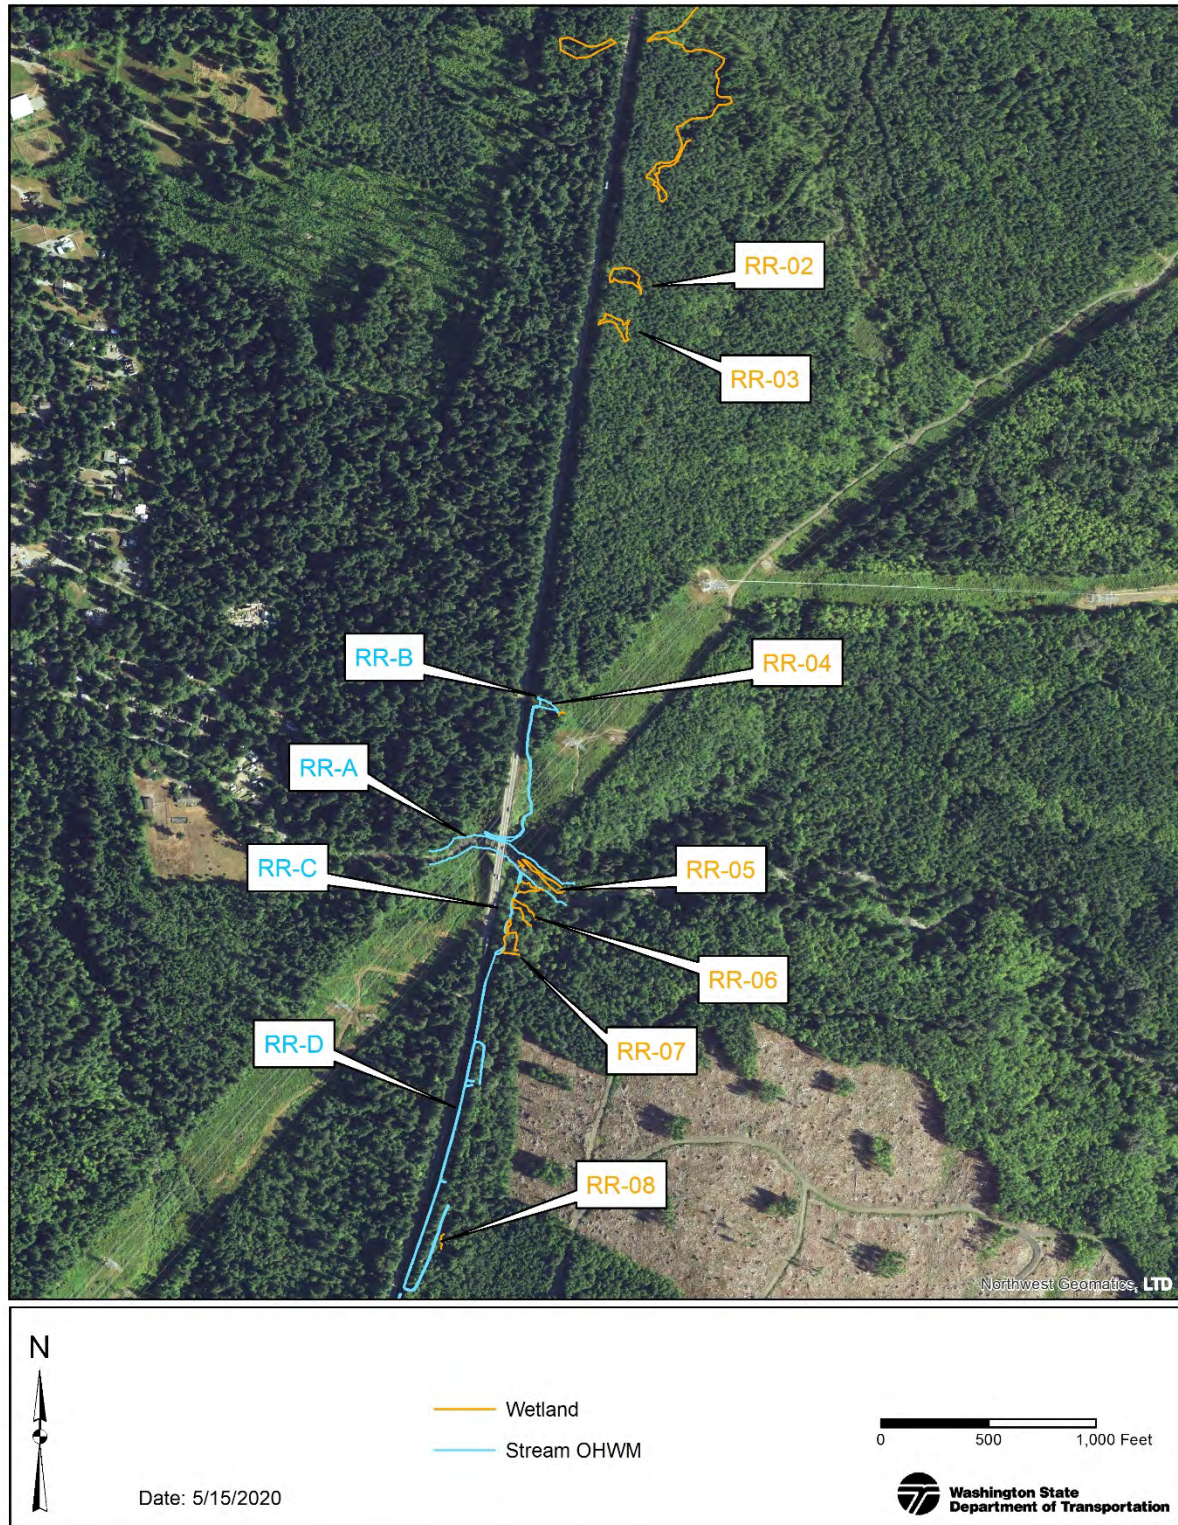

Figure 7. Wetlands and Streams Delineated in the Raging River Subwatershed

Table 28. Wetland RR-02 Summary

WETLAND RR-02 – INFORMATION SUMMARY		
Location:	Middle of the study area to the east of SR 18, north of Raging River, and south of Lake Creek	
		August 15, 2018
	Local Jurisdiction	King County
	WRIA	7 Snohomish
	Ecology (2014) Rating	II
	King County Buffer Width	300 feet
	Approximate Wetland Size (sf/acres)	8,000/0.18
	Cowardin Classification	PFO/PSS
	HGM Classification	Depressional
	Wetland Data Sheets	Appendix C; Sampling Point 27
Upland Data Sheets	Appendix C; Sampling Point 28	
Dominant Vegetation	Tree Stratum—Sitka spruce, western red cedar, and red alder. Sapling/Shrub Stratum—salmonberry, hardhack, twinberry honeysuckle, Pacific ninebark, and vine maple. Herbaceous Stratum—Slough sedge, water parsley, and reed canarygrass.	
Soils	Soils within Wetland RR-02 generally had six layers. The surface layer (0 to 1 inch) was 10YR 2/2 loam. The second layer (1 to 9 inches) was 10YR 3/1 silty clay loam with 10YR 3/6 and 7.5YR 3/4 concentrations, and 10YR 4/1 depletions. The third layer (9 to 11 inches) was 2.5Y 6/4 silty clay loam with 2.5Y 5/6 and 7.5YR 4/6 concentrations and 2.5Y 6/2 depletions. The fourth layer (11 to 13 inches) was 10YR 3/1 silty clay loam with 10YR 5/1 depletions. The fifth layer (13 to 15 inches) was 10YR 4/1 silty clay loam with 10YR 5/1 depletions. The sixth layer (15 to 17 inches) was 7.5YR 5/8 silty clay loam with 2.5Y 6/1 depletions. These soils met the criteria for hydric soil indicator F6 (redox dark surface).	
Hydrology	A high water table is the primary source of hydrology for Wetland RR-02. Additional hydrologic inputs include precipitation and runoff from SR 18. No outlet was identified while in the field.	
Rationale for Delineation	Depressional wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.	
Rationale for Local Rating	Wetland RR-02 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.	
Wetland Functions Summary		
Water Quality	High potential to trap sediments due to high seasonal ponding area and densely established persistent vegetation cover of over half the wetland. Wetland RR-02 also has no outlet; therefore, surface water remains within the wetland for a longer duration, which allows more time for sediment/pollutant settlement from the water column; low landscape potential due to lack of proximity to stormwater discharges and pollutant sources; high societal value because Wetland RR-02 is located within a basin with a TMDL (Raging River basin).	
Hydrologic	Moderate site potential for slowing flood velocities due to surface water storage capabilities (marks of ponding between 0.5 feet and 2 feet from the bottom of the outlet); Wetland RR-02 does not receive stormwater or is within proximity to land uses generating excess runoff or pollution; therefore, landscape potential for hydrologic function is low.	
Habitat	Moderate habitat quality with scrub-shrub plant communities and multiple hydroperiods and moderate habitat interspersions. Special habitat features include large downed wood, snags, and low presence of invasive plant cover.	
Buffer Condition	Buffer for Wetland RR-02 is limited to the west by SR 18; buffer extending east is relatively undisturbed forest consisting primarily of western hemlock and Douglas-fir. Wetland RR-02 is part of a vegetated corridor at least 50 feet wide and connects to undisturbed uplands at least 25 acres in size.	

Table 29. Wetland RR-03 Summary

WETLAND RR-03 – INFORMATION SUMMARY			
Location:	Middle of the study area to the east of SR 18, north of Raging River, and south of Lake Creek		
	Delineation Date	August 15, 2018	
	Local Jurisdiction	King County	
	WRIA	7 Snohomish	
	Ecology (2014) Rating	III	
	King County Buffer Width	300 feet	
	Approximate Wetland Size (sf/acres)	4,900/0.07	
	Cowardin Classification	PFO/PSS	
	HGM Classification	Depressional	
	Wetland Data Sheets	Appendix C; Sampling Point 25	
Upland Data Sheets	Appendix C; Sampling Point 26		
Dominant Vegetation	Trees—Red alder. Shrubs—salmonberry, red alder, vine maple, and trailing blackberry. Herbaceous—American skunk-cabbage, common ladyfern, western swordfern, and slough sedge.		
Soils	Soils within Wetland RR-03 generally had three layers. The surface layer (0 to 6 inches) was 10YR 4/1 silt loam. The second layer (6 to 11 inches) was 10YR 4/1 silt loam with 10YR 3/6, 10YR 6/6, and 10YR 2/1 concentrations and 10YR 5/1 and 7.5YR 4/1 depletions. The third layer (11 to 18 inches) was 10YR 6/4 silt loam with 10YR 5/6, 10YR 4/6, and 10YR 2/1 concentrations. These soils met the criteria for hydric soil indicator F3 (depleted matrix).		
Hydrology	A high water table is the primary source of hydrology for Wetland RR-03. Additional hydrologic inputs include precipitation. Evidence of ponding was observed. No outlet was identified while the project biologists were in the field.		
Rationale for Delineation	Depressional wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.		
Rationale for Local Rating	Wetland RR-03 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.		
Wetland Functions Summary			
Water Quality	Moderate potential to trap sediments due to seasonal ponding and densely established persistent vegetation cover of over half the wetland. Wetland RR-03 also has no outlet; therefore, surface water remains within the wetland for a longer duration, which allows more time for sediment/pollutants settlement from the water column; low landscape potential due to lack of proximity to stormwater discharges and pollutant sources; high societal value because Wetland RR-03 is located within a basin with a TMDL (Raging River basin).		
Hydrologic	Moderate site potential for slowing flood velocities due to surface water storage capabilities (marks of ponding between 0.5 feet and 2 feet from the bottom of the outlet); Wetland 30 does not receive stormwater or is within proximity to land uses generating excess runoff or pollution; therefore, landscape potential for hydrologic function is low.		
Habitat	Moderate habitat quality with scrub-shrub plant communities and multiple hydroperiods and low habitat interspersions. Special habitat features include large downed wood, snags, and low presence of invasive plant cover.		
Buffer Condition	Buffer for Wetland RR-03 is limited to the west by SR 18; buffer extending east is relatively undisturbed forest consisting primarily of western hemlock and Douglas-fir. Wetland RR-03 is part of a vegetated corridor at least 50 feet wide and connects to undisturbed uplands at least 25 acres in size.		

Table 30. Wetland RR-04 Summary

WETLAND RR-04 – INFORMATION SUMMARY			
Location:	Middle of the study area to the north of the Raging River and to the east of SR 18		
	Delineation Date	August 15, 2018	
	Local Jurisdiction	King County	
	WRIA	7 Snohomish	
	Ecology (2014) Rating	III	
	King County Buffer Width	300 feet	
	Approximate Wetland Size (sf/acres)	>5,000/0.12	
	Cowardin Classification	PFO	
	HGM Classification	Depressional/Riverine/Slope	
	Wetland Data Sheets	Appendix C; Sampling Point 23	
Upland Data Sheets	Appendix C; Sampling Point 24		
Dominant Vegetation	Trees—Red alder. Shrub—salmonberry, red elderberry (<i>Sambucus racemose</i>), and vine maple. Herbaceous—common ladyfern and giant horsetail.		
Soils	Soils within Wetland RR-04 generally had three layers. The surface layer (0 to 5 inches) was 10YR 2/2 silt loam. The second layer (5 to 9 inches) was 2.5Y 4/2 gravelly sandy loam with 10YR 3/1, 10YR 4/6, and 5Y 5/1 concentrations. The third layer (9 to 16 inches) was 2.5Y 4/2 gravelly sandy loam with 10YR 4/6 concentrations. These soils met the criteria for hydric soil indicators A11 (depleted below dark surface) and F3 (depleted matrix).		
Hydrology	A high water table and overbank flooding from Stream RR-B are the primary sources of hydrology for Wetland RR-04. Additional hydrologic inputs include precipitation. Water moves through Wetland RR-04 from east to west before draining to a roadside ditch adjacent to SR 18 and eventually the Raging River.		
Rationale for Delineation	Depressional/Riverine/Slope wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.		
Rationale for Local Rating	Wetland RR-04 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.		
Wetland Functions Summary			
Water Quality	Moderate potential to trap sediments because most of the wetland has densely established trees and shrubs, but lacks seasonal ponding capabilities to allow sediments to settle out of the water column; low landscape potential due to lack of proximity to stormwater discharges and pollutant sources; high societal value because Wetland RR-04 is located within a basin with a TMDL (Raging River basin).		
Hydrologic	Moderate site potential for slowing flood velocities due to high surface water storage capabilities (marks of ponding between 2 and 3 feet from the bottom of the outlet); Wetland RR-04 does not receive stormwater or is within proximity to land uses generating excess runoff or pollution; therefore, landscape potential for hydrologic function is low.		
Habitat	Wetland RR-04 has moderate habitat quality with one forest vegetation community and multiple hydroperiods with low habitat interspersion. Special features beneficial to wildlife include large downed wood, snags, and overhanging vegetation providing shade to a seasonal stream.		
Buffer Condition	Wetland RR-04 is limited to the west by SR 18. A small portion of the buffer extending east is relatively undisturbed until reaching the powerline easement clearing. Wetland RR-04 is part of a vegetated corridor connecting to other wetlands and to relatively undisturbed uplands greater than 25 acres in size.		

Table 31. Wetland RR-05 Summary

WETLAND RR-05 – INFORMATION SUMMARY			
Location:	Middle of the study area within the Raging River and to the east of SR 18		
	Delineation Date	August 15, 2018	
	Local Jurisdiction	King County	
	WRIA	7 Snohomish	
	Ecology (2014) Rating	II	
	King County Buffer Width	300 feet	
	Approximate Wetland Size (sf/acres)	4,500/0.10	
	Cowardin Classification	PSS	
	HGM Classification	Riverine	
	Wetland Data Sheets	Appendix C; Sampling Point 7	
	Upland Data Sheets	Appendix C; Sampling Point 8	
Dominant Vegetation	Trees – none. Shrubs—Sitka willow (<i>Salix sitchensis</i>), shining willow (<i>Salix lucida</i>), and salmonberry. Herbaceous—Smoothstem sedge (<i>Carex laeviculmis</i>), reed canarygrass, stinging nettles, common ladyfern, giant horsetail.		
Soils	Wetland RR-05 was located on a gravel bar below the OHWM of the Raging River. The recently deposited alluvial soils are considered problematic and may not have developed hydric soil indicators yet. The surface layer (0 to 10 inches) had multiple matrix colors and a cobbly sand texture. The bottom layer (10 to 12+) also had multiple matrix colors but had a sandy cobble texture.		
Hydrology	Wetland hydrology within Wetland RR-05 was supported by the Raging River and overbank flooding. Water moves through Wetland 24 from east to west.		
Rationale for Delineation	Riverine wetland with hydrophytic vegetation, fresh alluvium soil, and evidence of wetland hydrology.		
Rationale for Local Rating	Wetland RR-05 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.		
Wetland Functions Summary			
Water Quality	Moderate potential to trap sediments, as topographic depressions are present within the wetland and more than a third of the wetland has trees and shrubs established. Landscape potential is moderate, with dredging as a pollutant source entering Wetland RR-05.		
Hydrologic	Site potential for hydrologic function is moderate as tree and shrub cover is fairly high, but the low ratio of wetland to stream width limits the overbank storage potential. The stream adjacent to the wetland (Raging River) is not down-cut or controlled by dams upgradient, which factors into a moderate landscape potential for Wetland RR-05.		
Habitat	Habitat quality is moderate, with a single scrub-shrub vegetation community and various habitat features including large downed wood, vegetation overhanging the stream, and low invasive species cover. Four WDFW-listed Priority Habitats are present within 100 meters of Wetland RR-05: Biodiversity Areas and Corridors, Riparian, Instream, and Snags and Logs.		
Buffer Condition	The majority of land use surrounding the wetland is of moderate/low intensity with some undisturbed forest. Wetland RR-05 is part of a relatively undisturbed and unbroken corridor at least 50 feet wide that connects to undisturbed upland greater than 25 acres.		

Table 32. Wetland RR-06 Summary

WETLAND RR-06 – INFORMATION SUMMARY			
Location:	East of the SR 18 Bridge and to the south of the Raging River (Figure 7; Appendix A).		
	Delineation Date		August 15, 2018
	Local Jurisdiction		King County
	WRIA		7 Snohomish
	Ecology (2014) Rating		II
	King County Buffer Width		300 feet
	Approximate Wetland Size (sf/acres)		3,300/0.08
	Cowardin Classification		PFO / PSS
	HGM Classification		Slope
	Wetland Data Sheets		Appendix C; Sampling Point 14
Upland Data Sheets		Appendix C; Sampling Point 15	
Dominant Vegetation	Trees—Sitka spruce and red alder. Shrub—salmonberry. Herbaceous—common ladyfern, giant horsetail, and youth on age.		
Soils	Soils within Wetland RR-06 generally had three layers. The surface layer (0 to 1 inches) was 7.5YR 2.5/1 loam. The middle layer (1 to 11 inches) was 10YR 3/2. The bottom layer (11 to 24 inches) was 2.5Y 5/2 gravelly loam with 10YR 3/2 concentrations throughout the matrix. These soils met the criteria for hydric soil indicator A11 (depleted below dark surface).		
Hydrology	Wetland RR-06 is hydrologically supported by precipitation and surface runoff from SR 18. Water moves through Wetland RR-06 from south to north before ponding in shallow depressions and eventually draining to the Raging River.		
Rationale for Delineation	Slope wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.		
Rationale for Local Rating	Wetland RR-06 was rated using the Washington State Wetland Rating System for Western Washington – Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.		
Wetland Functions Summary			
Water Quality	Moderate potential to trap sediments due to seasonal ponding, densely established persistent vegetation, and a highly constricted outlet; moderate potential for water quality improvement within the landscape due to reception of stormwater discharges.		
Hydrologic	Moderate site potential for slowing floodwater velocities due to surface water storage capabilities (marks of ponding between 0.5 feet and 2 feet from the bottom of the outlet); moderate landscape potential due to reception of stormwater discharges and location within a contributing basin with more than 25% cover of intensive human land uses.		
Habitat	Moderate habitat quality with scrub-shrub plant communities and multiple hydroperiods with moderate habitat interspersion. Habitat features, including large downed wood and snags, provide habitat for small mammals, amphibians, and a variety of birds.		
Buffer Condition	Buffer for Wetland RR-06 is limited to the west by SR 18; buffer extending east is relatively undisturbed forest and Raging River is directly north. Wetland RR-06 is part of a vegetated corridor at least 50 feet wide and connects to undisturbed uplands at least 25 acres in size.		

Table 33. Wetland RR-07 Summary

WETLAND RR-07 – INFORMATION SUMMARY			
Location:	South of Raging River and to the east of SR 18 (Figure 7; Appendix A)		
	Delineation Date	November 16, 2018	
	Local Jurisdiction	King County	
	WRIA	7 Snohomish	
	Ecology (2014) Rating	II	
	King County Buffer Width	300 feet	
	Approximate Wetland Size (sf/acres)	>14,000/0.32	
	Cowardin Classification	PFO/PSS	
	HGM Classification	Depressional/Riverine	
	Wetland Data Sheets	Appendix C; Sampling Point 54	
	Upland Data Sheets	Appendix C; Sampling Point 55	
Dominant Vegetation	Trees—Sitka spruce, red alder, western red cedar, and vine maple. Sapling/shrubs—salmonberry, vine maple, western red cedar, and red alder. Herbaceous—youth on age, common ladyfern, and giant horsetail.		
Soils	Soils within Wetland RR-07 generally had three layers. The surface layer (0 to 7 inches) was 10YR 3/2 silt loam with 10YR 4/3 concentrations. The second layer (7 to 11 inches) was 10YR 3/2 silt loam with 2.5Y 5/1 depletions. The third layer (11 to 16 inches) was 10YR 3/2 silt loam with 10YR 3/4 and 10YR 4/3 concentrations. These soils met the criteria for hydric soil indicators F6 (loamy mucky mineral).		
Hydrology	Wetland hydrology within Wetland RR-07 was supported by a high groundwater table and water from Streams RR-C and RR-D, which are supported by road runoff from SR 18 and groundwater expression. Precipitation provides additional hydrology. Water moves through Wetland RR-07 from the south to north before draining to Wetland RR-06 and eventually the Raging River (RR-A) to the east of SR 18.		
Rationale for Delineation	Depressional wetland with sharp topographic breaks, hydrophytic vegetation, hydric soils, and strong evidence of wetland hydrology.		
Rationale for Local Rating	Wetland RR-07 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.		
Wetland Functions Summary			
Water Quality	Moderate potential to trap sediments due to seasonal ponding in greater than ¼ of the wetland, densely established persistent vegetation cover for 95% of the wetland, and an intermittently flowing outlet; moderate landscape potential due to reception of stormwater discharges; high societal value because of Wetland RR-07 location within a basin with a TMDL (Snoqualmie basin).		
Hydrologic	Moderate site potential for slowing flood velocities due to surface water storage capabilities (marks of ponding between 0.5 feet and 2 feet from the bottom of the outlet) and reception of stormwater discharges. Wetland RR-07 provides moderate societal value by storing water in a location where surface water is flooding downgradient.		
Habitat	Moderate habitat quality with scrub-shrub and forest plant communities, multiple hydroperiods, and low habitat interspersion. Special habitat features within the wetland include large downed wood, snags, and low invasive vegetation cover. There is also vegetation overhanging the seasonal stream within the wetland.		
Buffer Condition	Wetland RR-07 buffer is partially limited by SR 18 to the west; remaining buffer is relatively undisturbed forest consisting primarily of western hemlock and Douglas-fir. Approximately 200 feet south of the wetland is a large clear cut. Wetland RR-07 is part of a relatively undisturbed vegetated corridor that connects to other wetlands and to undisturbed uplands greater than 25 acres in size.		

Table 34. Wetland RR-08 Summary

WETLAND RR-08 – INFORMATION SUMMARY		
Location:	South end of study area to the north of Deep Creek and east of SR 18 (Figure 7; Appendix A).	
	Delineation Date	October 24, 2018
	Local Jurisdiction	King County
	WRIA	7 Snohomish
	Ecology (2014) Rating	III
	King County Buffer Width	300 feet
	Approximate Wetland Size (sf/acres)	>6,000/0.14
	Cowardin Classification	PFO/PSS
	HGM Classification	Depressional
	Wetland Data Sheets	Appendix C; Sampling Point 45
Upland Data Sheets	Appendix C; Sampling Point 46	
Dominant Vegetation	Trees—Western red cedar. Sapling/shrubs—salmonberry, vine maple, Himalayan blackberry. Herbaceous – none.	
Soils	Soils within Wetland RR-08 contained significant organic material but did not meet the criteria for an organic soil or muck. The surface layer (0 to 8 inches) was 10YR 2/2 silt loam. The middle layer (8 to 11 inches) was 10YR 3/1 silt loam. The bottom layer (11 to 16 inches) was 10YR 4/2 gravelly silt loam with 7.5YR 5/8 concentrations throughout the matrix. These soils met the criteria for hydric soil indicator A11 (depleted below dark surface).	
Hydrology	Wetland EE-08 is located within a depression with an intermittently flowing outlet. Wetland hydrology is supported by a high groundwater table.	
Rationale for Delineation	Depressional wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.	
Rationale for Local Rating	Wetland RR-08 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.	
Wetland Functions Summary		
Water Quality	Low site potential for water quality improvement due to minor seasonal ponding and lower coverage of persistent vegetation; low landscape potential due to lack of proximity to stormwater discharges and pollutant sources; high societal value because Wetland RR-08 is located within a basin with a TMDL (Raging River basin).	
Hydrologic	Low site potential due to low ponding capabilities; low landscape potential because site does not intercept stormwater discharges. Societal value is moderate due to flooding in the sub-basin downgradient from Wetland RR-08.	
Habitat	Moderate habitat quality with scrub-shrub and forest vegetation communities and large downed wood providing wildlife habitat. Three WDFW-listed Priority Habitats are present within 100 meters of Wetland RR-08: Riparian, Instream, and Snags and Logs.	
Buffer Condition	The majority of land abutting the wetland is undisturbed forest (although historically logged); Wetland RR-08 is part of a relatively undisturbed and unbroken corridor at least 150 feet wide, which connects to undisturbed upland greater than 250 acres.	

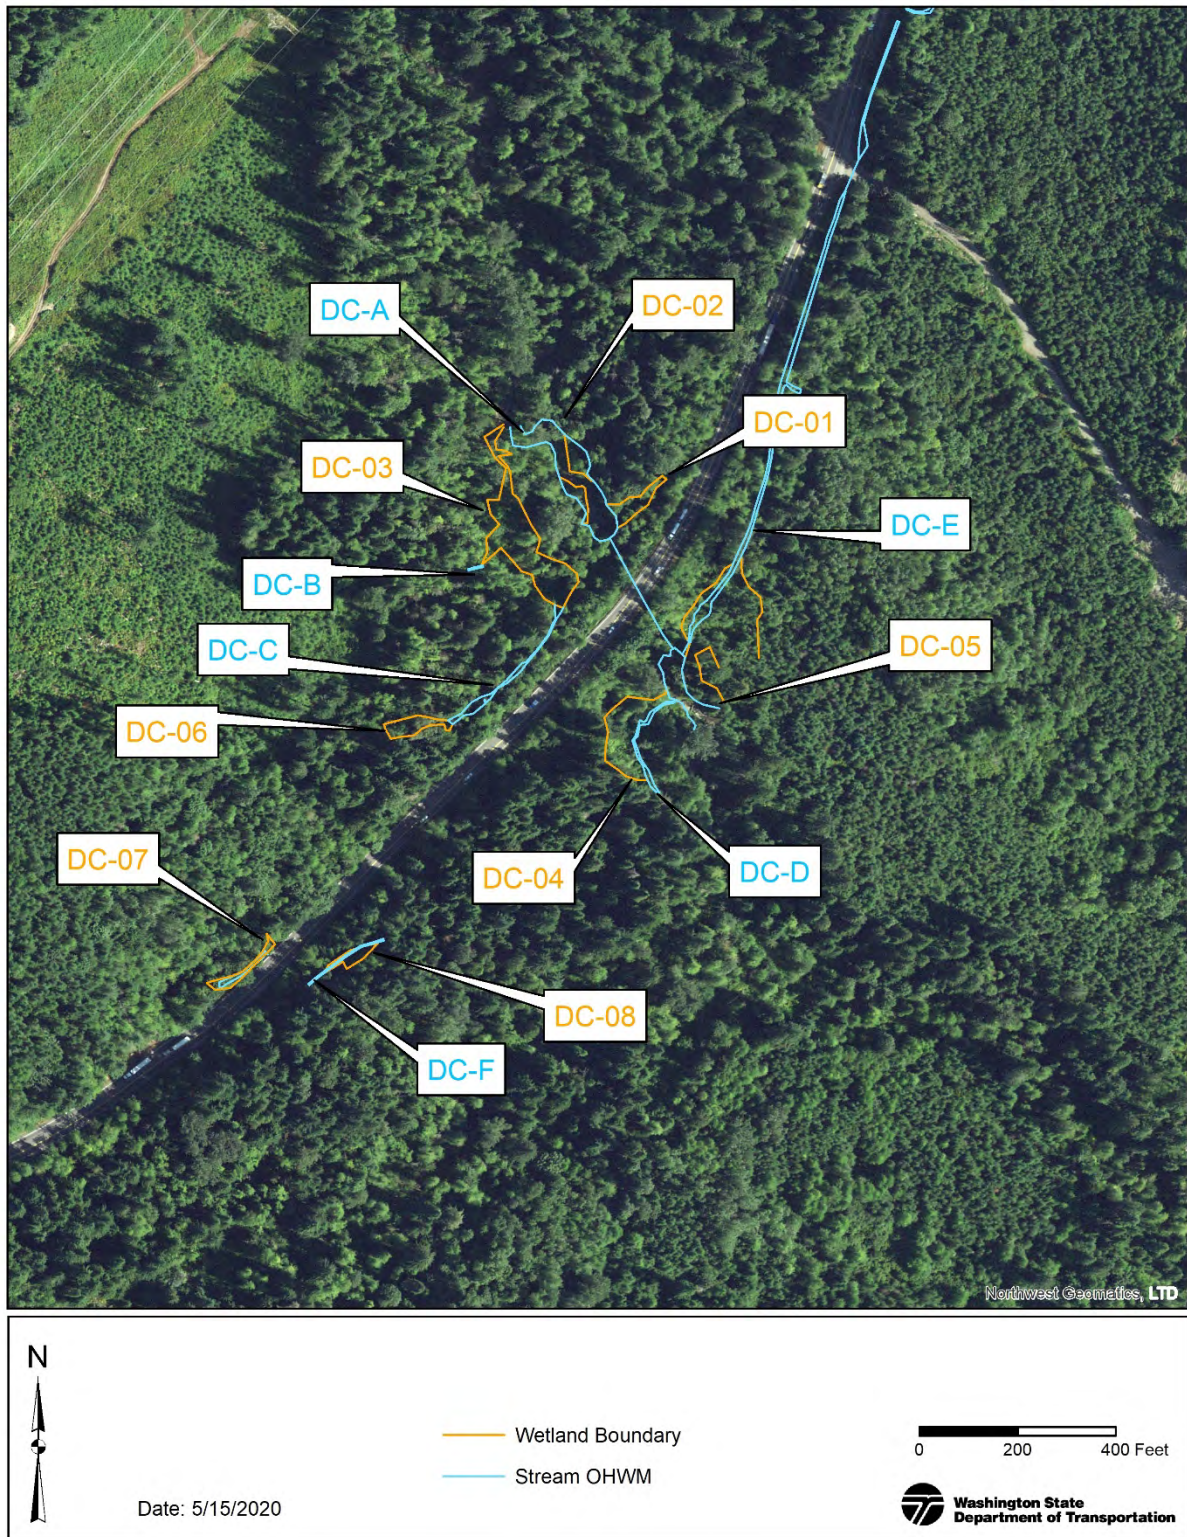

Figure 8. Wetlands and Streams Delineated in the Deep Creek Subwatershed

Table 35. Wetland DC-01 Summary

WETLAND DC-01 – INFORMATION SUMMARY		
Location:	South end of study area to the north of Deep Creek and west of SR 18 (Figure 8; Appendix A).	
	Delineation Date	August 25, 2018
	Local Jurisdiction	King County
	WRIA	7 Snohomish
	Ecology (2014) Rating	III
	King County Buffer Width	300 feet
	Approximate Wetland Size (sf/acres)	3,500/0.08
	Cowardin Classification	PFO/PSS
	HGM Classification	Slope
	Wetland Data Sheets	Appendix C; Sampling Point 16
	Upland Data Sheets	Appendix C; Sampling Point 17
Dominant Vegetation	Trees—Western red cedar and red alder Sapling/shrubs —salmonberry Herbaceous—Reed canarygrass, youth on age, American skunk-cabbage, common ladyfern, western swordfern, and fowl mannagrass.	
Soils	Soils within Wetland DC-01 generally had two layers. The surface layer (0 to 4 inches) was 10YR 2/2 gravelly loamy sand with 7.5YR 4/6 concentrations. The bottom layer (4 to 16 inches) was 10YR 5/2 with 10YR 4/1 depletions and 7.5YR 4/6 concentrations. These soils met the criteria for hydric soil indicators A11 (depleted below dark surface) and F3 (depleted matrix).	
Hydrology	Wetland DC-01 is a slope wetland located near Deep Creek (DC-A). Wetland hydrology is supported by hillslope seeps and a high groundwater table. Water moves through Wetland DC-01 from north to south before draining to Deep Creek (DC-A). Flowing water was observed within Wetland DC-01 throughout the dry season.	
Rationale for Delineation	Slope wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.	
Rationale for Local Rating	Wetland DC-01 was rated using the Washington State Wetland Rating System for Western Washington – Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.	
Wetland Functions Summary		
Water Quality	The moderate slope topography (between 2 and 5%) and low cover of dense woody plants contribute to a low potential for water quality improvements; low landscape potential due to lack of proximity to stormwater discharges and pollutant sources; high societal value because Wetland DC-01 is located within a basin with a TMDL (Raging River basin).	
Hydrologic	Wetland DC-01 has low landscape hydrologic function potential due to lack of surface depressions to hold back portions of flood flow; the wetland provides moderate societal value because surface water flooding is an issue farther downgradient.	
Habitat	Moderate habitat quality with scrub-shrub plant communities and multiple hydroperiods and moderate habitat interspersion. Habitat features including large downed wood, snags, and overhanging vegetation provide habitat for small mammals, amphibians, and birds.	
Buffer Condition	Wetland DC-01 buffer is limited to the east by SR 18; buffer extending west is relatively undisturbed forest consisting primarily of western hemlock and Douglas-fir. Wetland DC-01 is part of a relatively undisturbed vegetated corridor, which connects to other wetlands and to undisturbed uplands greater than 250 acres in size.	

Table 36. Wetland DC-02 Summary

WETLAND DC-02 – INFORMATION SUMMARY		
Location:	South end of study area along the left and right banks of Deep Creek and to the west of SR 18 (Figure 8; Appendix A).	
	Delineation Date	August 15, 2018
	Local Jurisdiction	King County
	WRIA	7 Snohomish
	Ecology (2014) Rating	II
	King County Buffer Width	300 feet
	Approximate Wetland Size (sf/acres)	4,250/0.10
	Cowardin Classification	PSS/PEM
	HGM Classification	Riverine
	Wetland Data Sheets	Appendix C; Sampling Point 18
Upland Data Sheets	Appendix C; Sampling Point 19	
Dominant Vegetation	Trees—Red alder and Scouler’s willow. Sapling/shrubs —Red alder, salmonberry, Scouler’s willow, stink currant. Herbaceous—Creeping buttercup, Kentucky bluegrass, fowl mannagrass, youth on age, giant horsetail, small-fruited bulrush, and coastal hedgenettle.	
Soils	The soils generally had one layer (0 to 16 inches) of 10YR 3/2 very gravelly loam with 7.5YR 4/6 concentrations. This soil met the criteria for hydric soil indicator F6 (Redox dark surface).	
Hydrology	Wetland hydrology within Wetland DC-02 was supported by the Deep Creek and overbank flooding. Water moves through Wetland DC-02 from east to west.	
Rationale for Delineation	Riverine wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.	
Rationale for Local Rating	Wetland DC-02 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.	
Wetland Functions Summary		
Water Quality	Moderate potential to trap sediments because most of the wetland has densely established trees and shrubs, but topographic depressions that allow sediments to settle out of the water column cover less than half of the wetland. Stormwater and road runoff pollution are received by Wetland DC-02 and factor into a moderate water quality improvement potential within the landscape.	
Hydrologic	Site potential for hydrologic function is moderate because tree and shrub cover is fairly high, but the low ratio of wetland to stream width limits overbank storage potential. The stream adjacent to the wetland (Deep Creek) is not down-cut or controlled by dams upgradient, which factors into a moderate landscape potential for Wetland DC-02.	
Habitat	Moderate habitat quality with emergent and scrub-shrub plant communities and multiple hydroperiods with low habitat interspersion. Special habitat features beneficial to fish and wildlife include large downed wood, snags, overhanging vegetation, signs of beaver use, and low invasive plant cover.	
Buffer Condition	Buffer function is fairly high for the circumference of the wetland with relatively undisturbed forest providing shade and habitat structure. Wetland DC-02 is part of a vegetated corridor connecting to other wetlands and relatively undisturbed uplands greater than 250 acres in size.	

Table 37. Wetland DC-03 Summary

WETLAND DC-03 – INFORMATION SUMMARY		
Location:	South end of study area, west of SR 18, and south of Deep Creek (Figure 8; Appendix A).	
	Delineation Date	November 16, 2018
	Local Jurisdiction	King County
	WRIA	7 Snohomish
	Ecology (2014) Rating	II
	King County Buffer Width	300 feet
	Approximate Wetland Size (sf/acres)	20,200/0.46
	Cowardin Classification	PFO/PSS
	HGM Classification	Depressional and Riverine
	Wetland Data Sheets	Appendix C; Sampling Points 57 and 59
Upland Data Sheets	Appendix C; Sampling Points 56, 58, and 60	
Dominant Vegetation	Trees—Red alder and western red cedar. Sapling/shrubs —salmonberry, stink currant, vine maple, and devil’s club. Herbaceous—common rush, slough sedge, common ladyfern, youth on age, and giant horsetail.	
Soils	Soils within Wetland DC-03 generally had two layers. The top layer (0 to 6 inches) was 10YR 3/1 loam. The second layer (6 to 16 inches) was 10YR 5/2 sandy loam with 10YR 4/6 and 7.5YR 3/4 concentrations. These soils met the criteria for hydric soil indicators A11 (depleted below dark surface) and F3 (depleted matrix).	
Hydrology	Wetland hydrology within Wetland DC-03 was supported by a high groundwater table, water from Streams DC-B and DC-C, and additional hydrologic inputs from precipitation. Water moves through Wetland 35 from the southeast to northwest before draining to Deep Creek (Stream DC-A) to the northwest of SR 18.	
Rationale for Delineation	Depressional wetland with sharp topographic breaks, hydrophytic vegetation, hydric soils, and strong evidence of wetland hydrology.	
Rationale for Local Rating	Wetland DC-03 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.	
Wetland Functions Summary		
Water Quality	Moderate potential to trap sediments due to seasonal ponding in greater than ¼ of the wetland, densely established persistent vegetation cover for 95% of the wetland, and an intermittently flowing outlet; moderate landscape potential due to reception of stormwater discharges; high societal value because Wetland DC-03 is located within a basin with a TMDL (Raging River basin).	
Hydrologic	Moderate site potential for slowing flood velocities due to surface water storage capabilities (marks of ponding between 0.5 feet and 2 feet from the bottom of the outlet) and reception of stormwater discharges. Wetland DC-03 provides moderate societal value by storing water in a location where surface water is flooding downgradient.	
Habitat	Moderate habitat quality with forested and scrub-shrub plant communities, multiple hydroperiods, and low habitat interspersions. Special habitat features include large downed wood and snags, thin-stemmed persistent plants beneficial for amphibians, and low invasive vegetation cover.	
Buffer Condition	Wetland DC-03 buffer is partially limited by SR 18 to the east; remaining buffer is relatively undisturbed forest consisting primarily of western hemlock and Douglas-fir. A powerline easement clearing is located approximately 300 feet northwest of the wetland. Wetland DC-03 is part of a relatively undisturbed vegetated corridor that connects to other wetlands and to undisturbed uplands greater than 25 acres in size.	

Table 38. Wetland DC-04 Summary

WETLAND DC-04 – INFORMATION SUMMARY			
Location:	South end of study area along the left bank of Deep Creek to the east of SR 18 (Figure 8; Appendix A).		
	Delineation Date	October 24, 2018	
	Local Jurisdiction	King County	
	WRIA	7 Snohomish	
	Ecology (2014) Rating	III	
	King County Buffer Width	300 feet	
	Approximate Wetland Size (sf/acres)	>28,250/0.64	
	Cowardin Classification	PFO/PSS	
	HGM Classification	Slope	
	Wetland Data Sheets	Appendix C; Sampling Point 44	
	Upland Data Sheets	Appendix C; Sampling Points 43	
Dominant Vegetation	Trees—Western red cedar, red alder, black cottonwood, Sitka spruce. Sapling/shrubs —salmonberry, redosier dogwood, stink currant (<i>Ribes bracteosum</i>), devil’s club, and Himalayan blackberry. Herbaceous—giant horsetail, American skunk-cabbage, reed canarygrass, and youth on age.		
Soils	Soils within Wetland DC-04 generally had three layers. The surface layer (0 to 3 inches) was 10YR 3/3 silt loam. The middle layer (3 to 11 inches) was 10YR 3/2 loam with 10YR 3/4 concentrations. The bottom layer (11 to 16 inches) was 10YR 3/1 gravelly loam with 10YR 3/6 concentrations throughout the matrix and pore linings. These soils met the criteria for hydric soil indicator F6 (redox dark surface).		
Hydrology	Wetland DC-04 is a slope wetland located near Deep Creek (DC-A) and DC-D. Wetland hydrology is supported by hillslope seeps and a high groundwater table supported by the local streams. Water moves through Wetland DC-04 before being conveyed off site through DC-D and eventually to Deep Creek (DC-A). Flowing and ponded water within Wetland DC-04 was observed throughout the dry season.		
Rationale for Delineation	Slope wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.		
Rationale for Local Rating	Wetland DC-04 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.		
Wetland Functions Summary			
Water Quality	Low site potential for water quality functions due to a steeper slope topography (>5%) and lower dense herbaceous coverage. Wetland DC-04 does not have any known pollutant sources in proximity; thus, the landscape potential is also low.		
Hydrologic	Wetland DC-04 site potential and landscape potential for hydrologic functions are low due to a lack of dense vegetation to slow floodwaters and lack of proximity to excess surface water runoff sources. Societal value of the wetland is high due to flooding in the sub-basin immediately downgradient.		
Habitat	Moderate habitat quality with scrub-shrub and forest vegetation communities and special habitat features including large downed wood, snags, and overhanging vegetation. Plant species richness and interspersion of habitats are moderate.		
Buffer Condition	The majority of land abutting the wetland is undisturbed forest (although historically logged); Wetland DC-04 is part of a relatively undisturbed and unbroken corridor at least 150 feet wide, which connects to undisturbed upland greater than 250 acres.		

Table 39. Wetland DC-05 Summary

WETLAND DC-05 – INFORMATION SUMMARY		
Location:	South end of study area, east of SR 18, and north of Deep Creek (Figure 8; Appendix A).	
	Delineation Date	October 24, 2018
	Local Jurisdiction	King County
	WRIA	7 Snohomish
	Ecology (2014) Rating	III
	King County Buffer Width	300 feet
	Approximate Wetland Size (sf/acres)	>26,900/0.61
	Cowardin Classification	PFO/PSS
	HGM Classification	Slope
	Wetland Data Sheets	Appendix C; Sampling Point 41
Upland Data Sheets	Appendix C; Sampling Point 42	
Dominant Vegetation	Trees—Western red cedar. Sapling/shrubs —salmonberry. Herbaceous—common ladyfern, American skunk-cabbage, giant horsetail, and youth on age.	
Soils	Soils within Wetland DC-05 generally had three layers. The top layer (0 to 7 inches) was 10YR 2/2 silt loam. The middle layer (7 to 11 inches) was 10YR 3/2 silt loam. The bottom layer (11 to 16 inches) was 10YR 4/2 silt loam with 10YR 5/6 concentrations. These soils met the criteria for hydric soil indicator A11 (depleted below dark surface).	
Hydrology	Wetland hydrology within Wetland DC-05 was supported by a high groundwater table with additional inputs from precipitation. Water moves through Wetland DC-05 from south to north before being conveyed off site through Stream DC-E and eventually Deep Creek (Stream DC-A).	
Rationale for Delineation	Slope wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.	
Rationale for Local Rating	Wetland DC-05 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.	
Wetland Functions Summary		
Water Quality	The moderate slope topography (between 2 and 5% on average) and low cover of dense woody plants contribute to a low potential for water quality improvements; moderate landscape potential due to proximity to stormwater discharges and pollutant sources; high societal value because Wetland DC-05 is located within a basin with a TMDL (Raging River basin).	
Hydrologic	Low site and landscape potential for hydrologic functions due to low cover of dense rigid vegetation to slow floodwater velocities and lack of proximity to land uses generating excess surface runoff; high societal value because flooding occurs in the sub-basin immediately downgradient of Wetland DC-05.	
Habitat	Moderate habitat quality with scrub-shrub plant communities and multiple hydroperiods and moderate habitat interspersion. Special habitat features include large downed wood, snags, low invasive species presence, thin-stemmed vegetation, and overhanging vegetation providing shade to a seasonal stream.	
Buffer Condition	Wetland DC-05 buffer is partially limited by SR 18; remaining buffer is relatively undisturbed forest consisting primarily of western hemlock and Douglas-fir. Wetland DC-05 is part of a relatively undisturbed vegetated corridor which connects to other wetlands and to undisturbed uplands greater than 250 acres in size.	

Table 40. Wetland DC-06 Summary

WETLAND DC-06 – INFORMATION SUMMARY		
Location:	South end of study area, west of SR 18, and south of Deep Creek (Figure 8; Appendix A).	
	Delineation Date	March 12, 2020
	Local Jurisdiction	King County
	WRIA	7 Snohomish
	Ecology (2014) Rating	II
	King County Buffer Width	150 feet
	Approximate Wetland Size (sf/acres)	3,441/0.08
	Cowardin Classification	PSS
	HGM Classification	Depressional
	Wetland Data Sheets	Appendix C; Sampling Point 64 and 65
	Upland Data Sheets	Appendix C; Sampling Point 62 and 63
Dominant Vegetation	Trees—Red alder and vine maple. Sapling/shrubs —salmonberry. Herbaceous—sword fern and piggyback plant.	
Soils	Soils within Wetland DC-06 generally had two layers. The top layer (0 to 8 inches) was 10YR 2/2 gravelly loam with 10YR 4/6 concentrations. The middle layer (8 to 16 inches) was 10YR 3/2 gravelly loam with 10YR 4/6 concentrations. These soils met the criteria for hydric soil indicator F6 (redox dark surface).	
Hydrology	Wetland hydrology within Wetland DC-06 was supported by a high groundwater table with additional inputs from precipitation. Water moves through Wetland DC-06 from south to north before being conveyed through Stream DC-C and eventually to Deep Creek (Stream DC-A).	
Rationale for Delineation	Depressional wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.	
Rationale for Local Rating	Wetland DC-06 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.	
Wetland Functions Summary		
Water Quality	The moderate slope topography (between 2 and 5% on average) and low cover of dense woody plants contribute to a moderate potential for water quality improvements; high landscape potential due to proximity to stormwater discharges and pollutant sources; high societal value because Wetland DC-06 is located within a basin with a TMDL (Raging River basin).	
Hydrologic	Low site and landscape potential for hydrologic functions due to low cover of dense rigid vegetation to slow floodwater velocities and moderate landscape potential due to proximity to land uses generating excess surface runoff; high societal value because flooding occurs in the sub-basin immediately downgradient of Wetland DC-06.	
Habitat	Moderate habitat quality with scrub-shrub plant communities and low habitat interspersion. High percentage of undisturbed or moderate/low intensity land uses surrounding wetland. Special habitat features include large downed wood and low invasive species presence.	
Buffer Condition	Wetland DC-06 buffer is partially limited by SR 18; remaining buffer is relatively undisturbed forest consisting primarily of western hemlock and Douglas-fir. Wetland DC-06 is part of a relatively undisturbed vegetated corridor which connects to other wetlands and to undisturbed uplands greater than 250 acres in size.	

Table 41. Wetland DC-07 Summary

WETLAND DC-07 – INFORMATION SUMMARY		
Location:	South end of study area, west of SR 18, and south of Deep Creek (Figure 8; Appendix A).	
	Delineation Date	March 13, 2020
	Local Jurisdiction	King County
	WRIA	7 Snohomish
	Ecology (2014) Rating	II
	King County Buffer Width	300 feet
	Approximate Wetland Size (sf/acres)	1,263/0.029
	Cowardin Classification	PSS/PEM
	HGM Classification	Riverine
	Wetland Data Sheets	Appendix C; Sampling Point 68
Upland Data Sheets	Appendix C; Sampling Point 69	
Dominant Vegetation	Trees—Red alder and Western red cedar. Sapling/shrubs —salmonberry. Herbaceous—piggyback plant.	
Soils	Soils within Wetland DC-07 generally had two layers. The top layer (0 to 10 inches) was 2.5Y 3/2 cobbly loam with 2.5Y 4/4 concentrations and 2.5Y 4/2 depletions. The bottom layer (10+ inches) was 2.5Y 4/2 loam with 2.5Y 5/6 concentrations. These soils met the criteria for hydric soil indicators F3 (depleted matrix) and F6 (redox dark surface).	
Hydrology	Wetland hydrology within Wetland DC-07 was supported by precipitation from drainage patterns and geomorphic position, and Stream DC-F. Water flows downslope and moves through Wetland DC-07 from south to north before being conveyed through Stream DC-F and eventually Deep Creek (Stream DC-A).	
Rationale for Delineation	Riverine wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.	
Rationale for Local Rating	Wetland DC-07 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.	
Wetland Functions Summary		
Water Quality	The moderate slope topography (between 2 and 5% on average) and cover of dense woody plants contribute to a moderate potential for water quality improvements; moderate landscape potential due to proximity to stormwater discharges and pollutant sources; high societal value because Wetland DC-07 is located within a basin with a TMDL (Raging River basin).	
Hydrologic	Moderate site and landscape potential for hydrologic functions due to cover of dense rigid vegetation to slow floodwater velocities and proximity to land uses generating excess surface runoff; high societal value because flooding occurs in the sub-basin immediately downgradient of Wetland DC-07.	
Habitat	Moderate habitat quality with scrub-shrub plant communities and multiple hydroperiods and low habitat interspersion. Special habitat features include large downed wood, low invasive species presence, and overhanging vegetation providing shade to a seasonal stream.	
Buffer Condition	Wetland DC-07 buffer is partially limited by SR 18; remaining buffer is relatively undisturbed forest consisting primarily of western hemlock and Douglas-fir. Wetland DC-07 is part of a relatively undisturbed vegetated corridor which connects to other wetlands and to undisturbed uplands greater than 250 acres in size.	

Table 42. Wetland DC-08 Summary

WETLAND DC-08 – INFORMATION SUMMARY		
Location:	South end of study area, east of SR 18, and south of Deep Creek (Figure 8; Appendix A).	
	Delineation Date	March 13, 2020
	Local Jurisdiction	King County
	WRIA	7 Snohomish
	Ecology (2014) Rating	II
	King County Buffer Width	300 feet
	Approximate Wetland Size (sf/acres)	1,995/0.05
	Cowardin Classification	PSS/PEM
	HGM Classification	Riverine
	Wetland Data Sheets	Appendix C; Sampling Point 70
Upland Data Sheets	Appendix C; Sampling Point 71	
Dominant Vegetation	Trees—None. Sapling/shrubs —salmonberry and Western red cedar. Herbaceous—sword fern and piggyback plant.	
Soils	Soils within Wetland DC-08 generally had three layers. The top layer (0 to 7 inches) was 10YR 2/2 gravelly sand with 10YR 4/6 concentrations. The middle layer (9 to 12 inches) was 10YR 2/2 sandy loam with 10YR 4/6 concentrations. The bottom layer (12+ inches) was 10YR 4/2 sandy loam with 10YR 4/6 concentrations. These soils met the criteria for hydric soil indicator S5 (sandy redox).	
Hydrology	Wetland hydrology within Wetland DC-08 was supported by overbank flooding from stream DC-F and high groundwater table with additional inputs from precipitation. Water moves through Wetland DC-08 from south to north before being conveyed off site through Stream DC-F and eventually Deep Creek (Stream DC-A).	
Rationale for Delineation	Riverine wetland with hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.	
Rationale for Local Rating	Wetland DC-08 was rated using the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014) in accordance with King County Code. The wetland was rated based on functions provided by the wetland because no special wetland characteristics were observed.	
Wetland Functions Summary		
Water Quality	Depressions and cover of dense woody plants contribute to a moderate potential for water quality improvements; moderate landscape potential due to proximity to stormwater discharges and pollutant sources; high societal value because Wetland DC-08 is located within a basin with a TMDL (Raging River basin).	
Hydrologic	High site and landscape potential for hydrologic functions due to cover of dense rigid vegetation to slow floodwater velocities and proximity to land uses generating excess surface runoff; moderate societal value because flooding occurs in the sub-basin immediately downgradient of Wetland DC-08.	
Habitat	Moderate habitat quality with scrub-shrub plant communities and multiple hydroperiods and low habitat interspersion. Special habitat features include large downed wood, snags, low invasive species presence, and overhanging vegetation providing shade to a seasonal stream.	
Buffer Condition	Wetland DC-08 buffer is partially limited by SR 18; remaining buffer is relatively undisturbed forest consisting primarily of western hemlock and Douglas-fir. Wetland DC-08 is part of a relatively undisturbed vegetated corridor which connects to other wetlands and to undisturbed uplands greater than 250 acres in size.	

Ditches

Biologists evaluated stormwater conveyance ditches to determine if they meet Corps criteria for jurisdictional features or are waters of the state and regulated by Ecology. Throughout the project area, these features are generally constructed in uplands, convey water to a downstream traditional navigable water or other water of the U.S., and were determined to have relatively permanent flow based on OHWM indicators. A total of 50 potentially jurisdictional ditches were identified and field forms were completed for all ditches in the project area (Appendix F).

Streams

A total of 20 streams were identified and mapped in the study area. These streams are as follows: Lake Creek (Stream LC-A), the Raging River (Stream RR-A), and Deep Creek (Stream DC-A); eight unnamed tributaries to Lake Creek (Streams LC-B through LC-J); three unnamed tributaries to the Raging River (Streams RR-B through RR-D); and five unnamed tributaries to Deep Creek (Streams DC-B through DC-F). Lake Creek and Deep Creek are major tributaries to the Raging River. Fish presence or absence was assessed by reviewing WDNR water type maps, WDFW fish distribution maps, and using best professional judgement of field observations of obstructions, steep slopes, and other observations. Based on these observations, approximately 14 of the 20 streams are accessible or provide fish habitat for resident or anadromous fish. Table 43 provides a summary of the streams; Tables 44 through 58 describe the streams; and Figures 5-8 above and the figures in Appendix A show all the streams in the study area.

Lake Creek flows west approximately 1 mile from the SR 18 crossing to its confluence with the Raging River. Lake Creek contains documented fish including Chinook and coho salmon and steelhead trout (WDFW 2018a, 2018b).

Streams LC-B through LC-J discharge to Lake Creek. Streams LC-B and LC-C flow north and parallel SR 18 south of Lake Creek. Streams LC-B and LC-C flow through straight, ditched channels below the SR 18 roadway structure. Stream LC-B supports salmonid use and Stream LC-C is assumed to provide fish habitat due to its connection to Lake Creek. These streams generally do not provide adult fish habitat but may provide refugia for juvenile fish during high flow events in Lake Creek.

Stream LC-D discharges to Lake Creek to the southwest of the I-90/SR 18 interchange. Stream LC-E discharges to Lake Creek after flowing from the northwest corner of the I-90/SR 18 interchange to conveying through culverts under the interchange. Stream LC-F flows from the north of the interchange in a southerly direction before reaching its confluence with Stream LC-G at the northeast corner of the interchange. Stream LC-G then flows through straight, ditched channels before being conveyed through culverts toward Lake Creek to the south of the interchange. Both streams LC-G and LC-I are conveyed under SE 104th Street before draining to Lake Creek. Stream LC-H is located northeast of the interchange and flows in an easterly direction before reaching its confluence with Stream LC-G. Stream LC-J is located immediately west of SR 18 and flows in a southwesterly direction for approximately 100 feet before draining to Lake Creek.

The Raging River flows approximately 4.5 miles west to its confluence with the Snoqualmie River from the SR 18 crossing. The Raging River OHWM was delineated within the study area. Raging River tributary streams (Streams RR-B, RR-C, and RR-D) flow through straight, ditched channels below the SR 18 roadway structure for much of their length (Appendix A). Stream RR-B is not anticipated to support fish populations due to the ephemeral and seasonal nature of the stream and the highly disturbed connection to the Raging River. Due to the lack of a gradient barrier, it is assumed that fish may be able to access Stream RR-C from the Raging River. Stream RR-D, upstream of RR-C, has been determined to be non-fish bearing due to the lack of a historic channel, ditch-like feature along a through-cut highway, and steep drop to RR-C.

Deep Creek flows approximately 4,800 feet (0.91 mile) northwest from the SR 18 crossing to its confluence with the Raging River approximately 0.5 mile due west of the study area. Streams DC-B through DC-E drain to Deep Creek. Stream DC-D enters the left bank (LB) of Deep Creek approximately 75 feet upstream of the Deep Creek culvert beneath SR 18. Similarly, Stream DC-E enters the right bank (RB) of Deep Creek approximately 50 feet upstream of the Deep Creek culvert beneath SR 18. Streams DC-B and DC-C are steep and narrow streams that flow into Wetland DC-03 and disperse. Wetland DC-03 lacks a channel with a defined bed and bank and is not anticipated to support fish populations. Wetland DC-03 is connected to Deep Creek. Stream DC-F is a non-fish bearing stream that originates in Wetland DC-07, flows through a culvert beneath SR 18, and through Wetland DC-08 and is assumed to flow into Deep Creek east of the study area.

Table 43. Summary of Streams in the Study Area

Stream ^a	Discharges to	Stream Type (WDNR ^b /KCC ^c)	King County ^d /USFS Buffer Width (feet)
Lake Creek(LC)/LC-A	Raging River	F/F	165/300
LC-B	Lake Creek	F/F	165/300

Table 44. Lake Creek (Stream LC-A) Summary

LAKE CREEK/STREAM LC-A - INFORMATION SUMMARY			
Stream Name		Lake Creek—Stream LC-A	
	WRIA ID #	07-0393	
	Jurisdiction for Portion of Stream in Study Area	King County/USFS/WDNR	
	WDNR Stream Type	Type F, perennial	
	King County/USFS Buffer Width	165 feet/300 feet	
Location of Stream Relative to Project		Lake Creek flows east to west crossing SR 18 through a culvert just south of the I-90/SR 18 interchange. It is a tributary to the Raging River.	
Connectivity (where stream flows from/to)		The perennial flows in Lake Creek receive water from Echo Lake, which lies just south of the eastern project limits. The headwaters of this creek flow through riparian corridors and wetlands including large wetlands east of the study area and through Wetland LC-04 (Figure 6; Appendix A). The creek drains to the Raging River approximately 1 linear mile west of the western project limits. The Raging River is a tributary to the Snoqualmie River. The confluence of the two rivers is approximately 4.5 linear miles downstream and northwest of the project.	
Fish Presence		Lake Creek connects to the Raging River and contains documented coho, Chinook, and steelhead (WDFW 2018a, 2018b). However, Chinook use is typically limited to the lower reach closer to the confluence with the Raging River and outside the study area. Bull trout are presumed present within Lake Creek (WDFW 2018a). Other resident fish species may also have access to the fish habitat provided by Lake Creek. Largemouth bass were documented both upstream and downstream of the SR 18 crossing.	
Habitat		Lake Creek generally has a defined channel throughout the study area. Substrate in this area is mainly sand and gravel. Riffle/pool complexes with gravels and cobbles are not present in the portion of the stream in the study area, primarily due to the presence of multiple beaver dams both upstream and downstream of the SR 18 crossing. A scour pool created by the culvert under SR 18 is present within the study area, but it is not representative of a riffle/pool complex. Overhanging vegetation contributes organic matter, shade, and woody debris to the creek.	
Riparian/Buffer Condition		Riparian vegetation is generally intact for the entire length of Lake Creek and consists of mature mixed coniferous and deciduous forest with an understory dominated by native shrubs and herbaceous plants.	

Table 45. Stream LC-B Summary

STREAM LC-B - INFORMATION SUMMARY			
Stream Name		Unnamed stream—Stream LC-B	
	WRIA ID #		07-0393
	Jurisdiction for Portion of Stream in Study Area		King County/USFS
	WDNR Stream Type		Type F, seasonal
	King County/USFS Buffer Width		165 feet/300 feet
Location of Stream Relative to Project		Stream LC-B is located directly adjacent to SR 18 eastbound lanes at toe of slope.	
Connectivity (where stream flows from/to)		The creek has seasonal flows originating from two sources. Surface water flows out of the large Wetland LC-28 east of SR 18 and contributes flows to this creek. A second hydrologic input is from a culvert flowing east under SR 18, draining surface water from Wetland LC-02, contributing flows to this creek's headwaters. The creek parallels eastbound SR 18, flowing north, and empties into Lake Creek just upstream of the Lake Creek culvert under SR 18 (Figure 6; Appendix A).	
Fish Presence		Numerous juvenile coho salmon were observed throughout the wetted portion of the channel during field studies conducted in August 2018. The fish were trapped in small shallow pool areas while the majority of the channel was dry.	
Habitat		The creek is generally channelized at the toe of slope of eastbound SR 18. It lacks riffle/pool complexes and channel migration or meanders. Substrates are silty mud with some gravels. Overhanging coniferous and deciduous trees and shrubs contribute organic matter, limited amounts of woody debris, and shade.	
Riparian/Buffer Condition		Riparian vegetation is generally intact on the east side of Stream LC-B and consists of mature forested vegetation in Wetland LC-28 east of SR 18 dominated by red alder and western red cedar. A skinny strip of buffer, averaging approximately 20 feet wide, is present in some locations between the western OHWM of Stream LC-B and toe of slope of eastbound SR 18. In other areas the western OHWM is at or within approximately 5 feet of toe of slope of the SR 18 road prism. Portions of this western creek buffer are dominated by salmonberry, which provides some limited screening function from SR 18. Other western buffer areas are dominated by grasses and maintained by routine highway maintenance activities.	

Table 46. Stream LC-C Summary

STREAM LC-C - INFORMATION SUMMARY			
Stream Name		Unnamed stream—Stream LC-C	
	WRIA ID #		07-0393
	Jurisdiction for Portion of Stream in Study Area		King County/USFS
	WDNR Stream Type		Assumed type F, seasonal
	King County/USFS Buffer Width		165 feet/300 feet
Location of Stream Relative to Project		Stream LC-C is entirely within the study area. It parallels the westbound lanes of SR 18 near toe of slope of roadway structure, runs along the eastern boundary of Wetland LC-04, and then converges with the LB of Lake Creek immediately downstream of the Lake Creek culverts beneath SR 18.	
Connectivity (where stream flows from/to)		The creek has seasonal flows originating near the southeastern boundary of Wetland LC-04. A culvert under SR 18 allows flows from Stream LC-B to pass under the highway and enter the headwaters of this creek. The creek parallels westbound SR 18, flowing north, and empties into Lake Creek on the northeastern boundary of Wetland LC-04 (Figure 6; Appendix A).	
Fish Presence		Because of the highly channelized character of this stream and uniform silty substrate, necessary habitat elements required to support fish are not present, despite its connection to Lake Creek. It is possible the creek may provide refugia for juvenile fish during high flows in Lake Creek. Fish presence is not documented in this creek, but is assumed because of its connection to Lake Creek.	
Habitat		The creek is generally channelized at the toe of slope of westbound SR 18. It lacks riffle/pool complexes and channel migration or meanders. Substrates are silty mud. Overhanging coniferous and deciduous trees and shrubs contribute organic matter, small amounts of woody debris, and shade.	
Riparian/Buffer Condition		Riparian vegetation is generally intact on the west side of Stream LC-C and consists of mature forested vegetation in Wetland LC-04 dominated by red alder and black cottonwood. A strip of mature trees with a shrubby understory, generally 50 feet wide, buffers the eastern OHWM of Stream LC-C from SR 18.	

Table 47. Stream LC-D Summary

STREAM LC-D - INFORMATION SUMMARY		
Stream Name	Unnamed stream-Stream LC-D	
	WRIA ID #	07
	Jurisdiction for Portion of Stream in Study area	King County
	King County/ WDNR Stream Type	Assumed Type F/ Seasonal
	King County Buffer Width	165 feet
Location of Stream Relative to Project	Stream LC-D is located west of SB SR 18. The upstream portion originates north of I-90 and continues downstream to the south of I-90.	
Connectivity (where stream flows from/to)	Stream LC-D flows downstream from the median of I-90 on the west side of SB SR-18 before following in a southwesterly direction toward Lake Creek. It is assumed that the stream drains into Lake Creek outside of the project area. The stream has low summer flows originating from precipitation and stormwater runoff. Stormwater runs off both directions of I-90 and the median in the project area.	
Fish Presence	Fish use in the stream is assumed due to the stream meeting the physical criteria for fish use and the hydrologic connection to Lake Creek. The stream is flashy with low seasonal flows which can quickly swell to occasional high flows during and following precipitation events due to stormwater inputs off of I-90.	
Habitat	The stream is mostly a narrow and moderately channelized waterway that is perpendicular to I-90. It lacks riffle/pool complexes and channel migration or meanders. Substrates are silty with some very small cobble. Overhanging trees and shrubs contribute organic matter and partially shade some sections of the stream. However, minimal stream width and poor water quality input from stormwater contributes to relatively low-quality habitat for passerine birds, small mammals, and aquatic invertebrates.	
Riparian/Buffer Condition	Riparian vegetation along the length of the stream but is generally intact. In the northern reaches of the stream, the stream has a moderately well-functioning buffer. The riparian vegetation is dominated by large Douglas firs in the median of I-90, with understory vegetation including salmonberry and vine maple. Filtering and water quality improvement from runoff is moderate to high with a dense understory of vegetation. Further downstream (south) the stream is heavily shaded by dense Douglas and then salmonberry surrounded by small pockets of reed canarygrass and Douglas spiraea near the outlet of the corrugated metal pipe culvert under I-90, providing an improved buffer overall. Riparian vegetation south of I-90 is generally intact and consists of mature forested vegetation that includes mixed coniferous and deciduous trees with an understory of vine maple and salmonberry.	

Table 48. Stream LC-E Summary

STREAM LC-E - INFORMATION SUMMARY			
Stream Name		Unnamed stream-Stream LC-E	
	WRIA ID #		07
	Jurisdiction for Portion of Stream in Study area		King County
	King County/ WDNR Stream Type		Assumed Type F/ Perennial
	King County Buffer Width		165 feet
Location of Stream Relative to Project	Stream LC-E is located west of SB SR 18 and just south of the easternmost portion of the westbound auxiliary ramp onto WB I-90. The upstream portion originates north of the auxiliary ramp in ditched areas on top of road fill, and flows southward towards the auxiliary ramp prior to reaching its most upstream fish passage culvert barrier. Further upstream the stream is ditch habitat within upland that flows through several small metal pipe culverts.		
Connectivity (where stream flows from/to)	Stream LC-E flows downstream to the east toward SB SR 18 through one culvert fish passage barrier prior to turning south and flowing parallel to SB SR 18, where it flows in a southerly direction, flowing through two additional culvert barriers. Water flowing from north to south drains into Stream LC-G, where it then outlets to Stream LC-A (Lake Creek). The stream has low summer flows originating from precipitation and stormwater runoff from the auxiliary ramp and upstream local roads.		
Fish Presence	Fish use is anticipated due to the hydrologic connection to Lake Creek, which has known fish use. The stream meets the physical criteria for a fish-bearing stream, though there are downstream barriers blocking fish use currently. The stream is flashy with low seasonal flows which quickly swell to occasional high flows during and following precipitation events. However, due to its potential connection to Lake Creek, fish presence must be assumed.		
Habitat	The stream is mostly a narrow, channelized and excavated waterway that parallels the aux ramp and SR 18. It lacks riffle/pool complexes and channel migration or meanders. Substrates are mucky with some cobble and large gravel in some areas. Vegetation is limited to roadside grasses, common rush, and small red alder and cottonwood saplings. The vegetation does not shade the stream efficiently. Minimal stream width and poor water quality input from stormwater contributes to relatively low-quality habitat for passerine birds, small mammals, and aquatic invertebrates. A large portion of the stream flows within metal pipe culverts under the I-90/SR 18 interchange.		
Riparian/Buffer Condition	<p>Riparian vegetation is largely not intact and ranges in size and condition along the length of the stream. In the northwestern most reaches of the stream, the stream does not have a well-functioning buffer to the north as the auxiliary ramp is within a few feet of the stream. On the southern side of this portion of the stream lies Wetland LC-7. The riparian vegetation in LC-7 is low and includes mowed and maintained grasses and saplings less than 6 feet in high. Filtering and water quality improvement from runoff is moderate.</p> <p>Further downstream (south) the stream is partly shaded by soft rush (<i>Juncus effusus</i>) and reed canarygrass (<i>Phalaris arundinacea</i>) and Western red cedar (<i>Thuja plicata</i>) before entering piped culvers under the I-90/SR 18, providing an improved buffer. Riparian vegetation within the I-90/SR 18 interchange is non-existent within the piped culverts. Further downstream south of the interchange riparian vegetation improves to moderately sized willow (<i>Salix</i> sp.) and red osier dogwood (<i>Cornus sericea</i>).</p>		

Table 49. Stream LC-F Summary

STREAM LC-F - INFORMATION SUMMARY			
Stream Name		Unnamed tributary-Stream LC-F	
		WRIA ID #	07-0393
		Jurisdiction for Portion of Stream in Study area	King County
		King County/ WDNR Stream Type	Assumed Type N
		King County Buffer Width	65 feet
Location of Stream Relative to Project	Stream LC-F is a tributary to Stream LC-G. It is located east of NB SR 18 and north of WB I-90.		
Connectivity (where stream flows from/to)	Stream LC-F flows south from the northern extent of the project area on the east side of NB SR-18, before converging with Stream LC-G and discharging through an outfall conveying stormwater underneath I-90 and continuing to the south. The stream has low summer flows originating from precipitation, stormwater runoff, and possibly ground water.		
Fish Presence	No fish use is anticipated due to the ditched nature of the channel, paired with the culvert under I-90 that is a fish passage barrier. Further, the stream is flashy with low seasonal flows which quickly swell to occasional high flows during and following precipitation events, which is not suitable for supporting fish presence.		
Habitat	The tributary is a narrow, channelized and excavated waterway that parallels SR-18. It lacks riffle/pool complexes and channel migration or meanders. Substrates are silty mud with cobble and large gravel. Overhanging trees and shrubs in the southern extent of the tributary contribute organic matter and partially shade some sections of the stream. However, minimal stream width and poor water quality input from stormwater contributes to relatively low-quality habitat for passerine birds, small mammals, and aquatic invertebrates.		
Riparian/Buffer Condition	In the northern reaches of the tributary, the stream does not have a well-functioning buffer. The riparian vegetation is low and includes mowed and maintained grasses including velvet grass (<i>Holcus lanatus</i>) and herbs, including creeping buttercup, less than 12" in height. Filtering and water quality improvement from runoff is minimal. Further downstream (south) the stream is heavily shaded by dense red alder, providing an improved buffer.		

Table 50. Stream LC-G Summary

STREAM LC-G - INFORMATION SUMMARY			
Stream Name		Unnamed stream-Stream LC-G	
		WRIA ID #	07-0393
		Jurisdiction for Portion of Stream in Study area	King County
		King County/ WDNR Stream Type	Assumed Type F/ Perennial
		King County Buffer Width	165 feet
Location of Stream Relative to Project	Stream LC-G is located east of NB SR 18. The upstream portion originates north of I-90 and continues downstream to the south of I-90.		
Connectivity (where stream flows from/to)	<p>Stream LC-G appears to originate from a high groundwater table within an excavated and channelized stream channel. The stream flows east to west along the north side of WB I-90 and drains into Wetland LC-12. The stream then continues west and converges with Stream LC-F, a tributary to the north, before discharging through an outfall conveying stormwater underneath I-90 and continuing south along SR 18. The stream then flows through a short forested section and then through a roadside ditch which parallels SE 104th Street, before draining to Lake Creek.</p> <p>The stream has flows originating from precipitation, stormwater runoff, wetland contributions and ground water. Stormwater run-off from I-90 and SR-18, as well as the on- and off-ramps in the interchange, discharge into this creek with additional stormwater inputs from surrounding ditches and culverts likely.</p>		
Fish Presence	The culvert under I-90 and under SE 104th Street appear to be barriers to fish passage. However, due to its constant flow in most areas of the stream, and its connection to Lake Creek, fish presence is assumed.		
Habitat	The stream substrate ranges from silty mud with some small gravels to substrate consisting largely of cobbles and gravels. Overhanging coniferous and deciduous trees and shrubs contribute organic matter, small amounts of woody debris, and shade.		
Riparian/Buffer Condition	<p>Riparian vegetation is generally intact and consists of mature forested vegetation that includes mixed coniferous and deciduous trees (including red alder, black cottonwood, Douglas-fir and western red cedar) with an understory comprising salal, salmonberry, sword fern and cuttleleaf blackberry. Near the stormwater conveyance channel under I-90, the riparian buffer is reduced to shorter soft rush surrounded by reed canarygrass.</p> <p>South of I-90, the riparian buffer continues to be generally intact and consists of mature forested vegetation that includes mixed coniferous and deciduous trees with an understory of salal and salmonberry. Further downstream along the strip of ROW along SE 104th Street, the stream loses the functional buffer where maintained and mowed grasses become prevalent.</p>		

Table 51. Stream LC-H Summary

STREAM LC-H - INFORMATION SUMMARY			
Stream Name		Unnamed stream-Stream LC-H	
		WRIA ID #	07-0393
		Jurisdiction for Portion of Stream in Study area	King County
		King County/ WDNR Stream Type	Assumed Type F/ Seasonal
		King County Buffer Width	165 feet
Location of Stream Relative to Project	Stream LC-H is located east of NB SR 18. The upstream portion originates north of I-90 and continues downstream before out-letting into Stream LC-G.		
Connectivity (where stream flows from/to)	<p>Stream LC-H is estimated to flow downstream from the northeastern extent of the project area on the east side of NB SR-18 before following the curve of the WB I-90 on-ramp to NB SR 18. Water flowing from east to west is estimated to potentially drain Wetland LC-14 into Stream LC-G, converge with these western flows after discharging through a corrugated metal pipe culvert conveying Stream LC-H in the I-90 ROW and continuing to the south just east of NB SR 18. The stream is then estimated to parallel SE 104th Street before flowing through a culvert and discharging to a large wetland on the east of the project area (Wetland LC-24 complex).</p> <p>The stream has low summer flows originating from precipitation, stormwater runoff, and possibly ground water originating in Wetland LC-14. Stormwater runs off I-90 and the off-ramp in the project area.</p>		
Fish Presence	Fish use in the stream is assumed due to the stream meeting the physical criteria for a fish-bearing stream and the stream's hydrologic connection to Lake Creek, a documented fish-bearing stream. The current access to Lake Creek through the interchange is not currently accessible, but with barriers removed the stream could be potential juvenile rearing habitat.		
Habitat	The stream is mostly a narrow, channelized waterway that parallels the interchange and off-ramp in the area. It lacks riffle/pool complexes and channel migration or meanders. Substrates are silty mud with some cobble. Overhanging trees and shrubs contribute organic matter and partially shade some sections of the stream. Moderate stream width and poor water quality input from stormwater contributes to relatively low-quality habitat for passerine birds, small mammals, and aquatic invertebrates.		
Riparian/Buffer Condition	<p>Riparian vegetation is intact but ranges in size and condition along the length of the stream relative to the proximity to the I-90 off-ramp.</p> <p>In the eastern reaches of the stream, the stream has a well-functioning buffer. The riparian vegetation is high and includes unmowed grasses and herbs over 12" in height, as well as mature scrub/shrub and forested vegetation. Filtering and water quality improvement from runoff is high.</p> <p>Further downstream (west) the stream is heavily shaded by dense red alders and then by reed canarygrass near the corrugated metal pipe conveying Stream LC-H into Stream LC-G, providing a lower-functioning buffer.</p> <p>Riparian vegetation south of I-90 is generally intact and consists of mature forested vegetation that includes mixed coniferous and deciduous trees with an understory of salal and salmonberry. Further downstream along the strip of ROW along SE 104th Street, the stream loses the functional buffer where maintained and mowed grasses become prevalent.</p>		

Table 52. Stream LC-I Summary

STREAM LC-I - INFORMATION SUMMARY			
Stream Name		Unnamed stream—Stream LC-I	
	WRIA ID #		07-0393
	Jurisdiction for Portion of Stream in Study Area		King County
	WDNR Stream Type		Assumed type F, seasonal
	King County Buffer Width		165 feet
Location of Stream Relative to Project		Stream LC-I originates in the study area. The southern fork of the creek parallels SR 18 just north of the SE 104th Street and SR 18 intersection. The northern fork begins at a culvert at toe of slope along eastbound SR 18 lanes just before the eastbound I-90 on-ramp.	
Connectivity (where stream flows from/to)		The southern fork appears to originate from a high groundwater table. The northern fork receives stormwater from ditches associated with the transportation infrastructure. A culvert conveys stormwater from the west side of SR 18 and the eastbound I-90 off-ramp. A ditch along the westbound SR 18 lanes also conveys stormwater to the headwaters of the north fork of the stream. Both forks of the stream converge just east of SR 18 and flow east from that point. Both forks flow through straightened and excavated channels before leaving the study area through a culvert running east under SE 104th Street and discharging to a large wetland east of SE 104th Street. It is assumed that this is a seasonal stream with water flowing to Lake Creek through the wetland east of SE 104th Street.	
Fish Presence		It is unknown if the culvert under SE 104th Street is fish passable. It is small and appeared to be partially blocked and clogged, however the stream does provide habitat suitable for fish when seasonal flows are present and has seasonal connection to Lake Creek.	
Habitat		The creek is generally channelized and lacks riffle/pool complexes and channel migration or meanders. Substrates are silty mud with some small gravels. Overhanging coniferous and deciduous trees and shrubs contribute organic matter, small amounts of woody debris, and shade.	
Riparian/Buffer Condition		Riparian vegetation is generally intact surrounding Stream LC-I. Buffer vegetation consists of mature forested vegetation dominated by red alder, black cottonwood, Douglas-fir, and western red cedar with an understory of salmonberry and sword fern.	

Table 53. Stream LC-J Summary

STREAM LC-J - INFORMATION SUMMARY			
Stream Name		Unnamed stream-Stream LC-J	
		WRIA ID #	07
		Jurisdiction for Portion of Stream in Study area	King County
		King County/ WDNR Stream Type	Assumed Type F/ Seasonal
		King County Buffer Width	165 feet
Location of Stream Relative to Project	Stream LC-J is entirely within the study area. A channel is formed just west of SB SR 18 and continues for approximately 100 feet to the southwest. It converges with Lake Creek immediately downstream of the Lake Creek culverts beneath SR 18.		
Connectivity (where stream flows from/to)	Stream LC-J flows downstream from immediately west of SB SR 18 to the southwest and drains to Lake Creek. This stream is only approximately 100 feet in length and entirely within the project area. The stream has low summer flows originating from precipitation and stormwater runoff. Stormwater runs off SB SR 18 and SE 104 th St and sheet flows until forming a channel.		
Fish Presence	Because of the highly channelized character of this stream and uniform silty substrate, necessary habitat elements required to support fish are not present, despite its connection to Lake Creek. It is possible the creek may provide refugia for juvenile fish during high flows in Lake Creek. Fish presence is not documented in this creek, but is assumed because of its connection to Lake Creek.		
Habitat	The creek is generally channelized at the toe of slope of westbound SR 18. It lacks riffle/pool complexes and channel migration or meanders. Substrates are silty mud. Overhanging coniferous and deciduous trees and shrubs contribute organic matter, small amounts of woody debris, and shade.		
Riparian/Buffer Condition	Riparian vegetation is generally intact along Stream LC-J. Buffer vegetation consists of mature forested vegetation dominated by Douglas-fir and western red cedar with an understory of salmonberry, salal, and sword fern.		

Table 54. Raging River (Stream RR-A) Summary

RAGING RIVER/STREAM RR-A - INFORMATION SUMMARY			
Stream Name		Raging River—Stream RR-A	
		WRIA ID #	07-0384
		Jurisdiction for Portion of Stream in Study Area	King County/WDNR
		WDNR Stream Type	Type S
		King County Buffer Width	165 feet
Location of Stream Relative to Project		The Raging River, flowing generally east to west, crosses SR 18 approximately 1.5 miles south of the SR 18/I-90 interchange at approximately RM 7.9.	
Connectivity (where stream flows from/to)		The Raging River originates from the west and southwest slopes of Rattlesnake Mountain at an elevation of approximately 3,000 feet. It flows northerly about 5 miles to join the Snoqualmie River at RM 36.2 near Fall City at an elevation of about 100 feet.	
Fish Presence		In the study area, the Raging River supports both resident and anadromous salmonid populations including summer- and winter-run steelhead, fall Chinook salmon, coho salmon, and resident coastal cutthroat trout, and is presumed to be used by bull trout (WDFW 2018a, 2018b).	
Habitat		The Raging River within the study area can be characterized as primarily moderate gradient riffle habitat with some limited pool habitat associated with large boulders. Upstream the channel is slightly wider and contains some braiding and side channel habitat. Substrates are dominated by cobble and boulder with large and small gravels being sub-dominant. Overall good bank stability with some minor scour/undercutting downstream of the bridge. LWM (large woody material) is present in small amounts immediately upstream of the bridge with no key pieces within the channel downstream of the bridge.	
Riparian/Buffer Condition		High voltage power lines are located at the SR 18 crossing of the Raging River crossing at a skew to the bridge. Vegetation beneath the power line corridor is maintained and therefore trees have been removed and have been largely replaced with Himalayan blackberry and other low-growing shrubs and grasses. This is particularly evident on the southwest and northeast sides of the bridge. Areas outside the power line corridor are well vegetated and intact and includes a mixed coniferous/deciduous canopy. Dominant species include black cottonwood, red alder, Sitka spruce, bigleaf maple, western red cedar, willow, and western hemlock.	

Table 55. Stream RR-B Summary

STREAM RR-B - INFORMATION SUMMARY		
Stream Name	Unnamed stream—Stream RR-B	
	WRIA ID #	07-0384
	Jurisdiction for Portion of Stream in Study Area	King County/WDNR
	King County/ WDNR Stream Type	Type O/N, ephemeral
	King County Buffer Width	25 feet
Location of Stream Relative to Project	Stream RR-B discharges from Wetland RR-04 and enters a ditch conveyance feature at the base of slope adjacent to SR 18 eastbound lanes just north of the Raging River bridge.	
Connectivity (where stream flows from/to)	Stream RR-B discharges from Wetland RR-04 and enters a ditch conveyance feature at the base of slope adjacent to SR 18 eastbound lanes. The ditch-like conveyance then parallels the roadway flowing south before hitting an unimproved trail system where the stream sheet flows across the trail and diffuses out into a vegetated area before discharging to the RB of the Raging River to the east of the bridge. There is no direct connection via defined channel to the Raging River.	
Fish Presence	No fish use is anticipated due to the lack of a direct connection to the Raging River.	
Habitat	The stream system is isolated from the Raging River and there is a lack of direct hydraulic connection between the two waterbodies. The majority of the channel length paralleling the east side of SR 18 is channelized and steep as it leads down to the Raging River. Vegetative cover and the quality of canopy cover is diminished by the maintenance clearing for the overhead power lines that occurs along much of the lower reach.	
Riparian/Buffer Condition	Buffer width on the west side of the stream is narrow due to presence of SR 18; however, riparian conditions improve for the portion of the channel that flows through Wetland RR-04 and eastward. Dominant buffer species include: mature Sitka spruce and western red cedar with lesser amounts of bigleaf maple, vine maple, and western sword fern. Associated wetland vegetation includes red alder and salmonberry.	

Table 56. Stream RR-C Summary

STREAM RR-C - INFORMATION SUMMARY		
Stream Name	Unnamed stream—Stream RR-C	
	WRIA ID #	07-0384
	Jurisdiction for Portion of Stream in Study Area	King County/WDNR
	King County/WDNR Stream Type	Type F/Type N, seasonal
	King County Buffer Width	165 feet
Location of Stream Relative to Project	Stream RR-C is a channelized ditch immediately adjacent to SR 18 eastbound lanes near MP 26. Stream RR-C is located along the east side of SR 18 and discharges to the Raging River on the east side of the Raging River bridge.	
Connectivity (where stream flows from/to)	This stream drains areas adjacent to the roadway and hillslopes to the southeast of the Raging River bridge. It originates out of a hanging culvert on NE side of SR 18. It flows through Wetland RR-06 at the base of the slope and discharging to the LB of the Raging River immediately upstream of the bridge. The channel is lined with erosion control material, so it is assumed that roadway runoff is one of the primary sources of hydrology near the top the system. The stream discharges from the wetland to the Raging River via a steep cut bank.	
Fish Presence	In the study area, the Raging River supports both resident and anadromous salmonid populations including summer- and winter-run steelhead, fall Chinook salmon, Coho salmon, and resident coastal cutthroat trout, and is presumed to be used by bull trout (WDFW 2018a, 2018b). RR-C is accessible from the Raging River until the gradient barrier and long culvert conveying Steam RR-D.	
Habitat	Stream RR-C provides little habitat. The channel is lined with geotextile fabric, is incised at the outlet, and is seasonal in nature.	
Riparian/Buffer Condition	Dominant buffer species include: mature Sitka spruce and western red cedar with lesser amounts of big leaf maple, vine maple, and western swordfern. Associated wetland vegetation includes red alder, Sitka spruce, salmonberry, common ladyfern, and horsetail. Buffer width on the west side of the stream is narrow due to presence of SR 18; however, the east bank buffer is more intact.	

Table 57. Stream RR-D Summary

STREAM RR-D - INFORMATION SUMMARY			
Stream Name		Unnamed stream—Stream RR-D	
	WRIA ID #		07-0384
	Jurisdiction for Portion of Stream in Study Area		King County
	King County/WDNR Stream Type		Type N/N
	King County Buffer Width		65 feet
Location of Stream Relative to Project	Stream RR-D is a channelized ditch immediately adjacent to SR 18 eastbound lanes near MP 26.		
Connectivity (where stream flows from/to)	The stream has intermittent flows originating from wetlands and tributaries uphill and east of SR 18. The stream flows northward to almost the Raging River, where it enters a long culvert. It then discharges onto the hillside and forms Stream RR-C. The ditched channel is 2 to 3 feet wide and was clearly excavated to collect and convey hillside flow. Four short tributaries were identified on the west-facing hillside above the stream.		
Fish Presence	The stream discharges via a hanging culvert on a slope. No fish access is possible.		
Habitat	The creek is channelized along the roadside of westbound SR 18. It lacks habitat features and the bed is mostly silt. Trash has accumulated in the stream. <u>Overhanging deciduous shrubs provide some organic matter and shade.</u>		
Riparian/Buffer Condition	The east buffer is undisturbed forested upland. The west side is pavement of SR 18.		

Table 58. Deep Creek (Stream DC-A) Summary

DEEP CREEK/STREAM DC-A - INFORMATION SUMMARY		
Stream Name	Deep Creek—Stream DC-A	
	WRIA ID #	07-0396
	Jurisdiction for Portion of Stream in Study Area	King County/WDNR
	WDNR Stream Type	Type S
	King County Buffer Width	165 feet
Location of Stream Relative to Project	Deep Creek flows southeast to northwest through a culvert beneath SR 18 approximately 2.2 miles south of the SR 18/I-90 interchange near the southern terminus of the study area. Deep Creek is a LB tributary to the Raging River.	
Connectivity (where stream flows from/to)	Deep Creek originates on the north slopes of Taylor Mountain and flows north approximately 0.8 mile to the south side of SR 18, and then flows northeasterly for an additional 1.7 miles, where it turns due north flowing beneath SR 18 for an additional 0.9 mile where it joins the left bank of the raging River at RM 7.4. The drainage basin upstream of the SR 18 crossing is approximately 4.5 square miles.	
Fish Presence	Deep Creek is known to support fall Chinook salmon, coho salmon, and both summer-run and winter-run steelhead. Numerous juvenile coho were observed upstream of SR 18 during field studies conducted in August 2018.	
Habitat	Habitat upstream of the culvert under SR 18 can typically be characterized as moderate gradient riffle habitat with large quantities of bedload material built up at the culvert inlet. Substrates are dominated by cobble and large gravel with a high level of embeddedness with sand and silt. Several LWM jams are present upstream, contributing to habitat complexity. Downstream of the culvert a large scour/plunge pool has formed, with an approximate 2-foot to 3-foot drop from the culvert outlet to the water surface elevation during low flow condition. Downstream of the scour pool, the stream is characterized by riffle/pool complexes. Substrates are dominated by cobble and large gravel with some interspersions of boulders. LWM is present; however, the majority of key pieces are old with little or no recent LWM recruitment. Moderate amounts of bank undercutting and erosion are present.	
Riparian/Buffer Condition	Riparian vegetation is generally intact. Buffer vegetation consists of mature forested vegetation dominated by red alder, black cottonwood, western hemlock, Douglas-fir, Sitka spruce, bigleaf maple, and western red cedar with an understory of salmonberry, osoberry (<i>Oemleria cerasiformis</i>), vine maple, stink currant, red elderberry, red osier dogwood, and western swordfern.	

Table 59. Stream DC-B Summary

STREAM DC-B - INFORMATION SUMMARY			
Stream Name		Unnamed stream—Stream DC-B	
	WRIA ID #		07-0396
	Jurisdiction for Portion of Stream in Study Area		King County/WDNR
	King County/WDNR Stream Type		Type N/N
	King County Buffer Width		65 feet
Location of Stream Relative to Project		Stream DC-B is located to the west of SR 18 near Deep Creek. Stream DC-B directly abuts the south slope of Wetland DC-03.	
Connectivity (where stream flows from/to)		The stream originates from hillside seepage that is assumed to flow seasonally. The channel is approximately 3 feet wide and flows from south to north down a steep slope before discharging into Wetland DC-03 at the toe of the hillslope. Wetland DC-03, a sloped wetland, drains to Deep Creek just outside of the study area.	
Fish Presence		Stream DC-B is a steep stream that discharges into Wetland DC-03. Within Wetland DC-03, there is no defined or continuous channel, which is assumed to limit fish access from Deep Creek into Stream DC-B.	
Habitat		The stream channel is eroded and steep. Substrates include small and large cobbles. Overhanging coniferous and deciduous trees and shrubs contribute organic matter, limited amounts of woody debris, and shade.	
Riparian/Buffer Condition		The buffer is undisturbed forested upland. Vegetation includes red alder, western red cedar, salmonberry, stink currant, sword fern, and common ladyfern.	

Table 60. Stream DC-C Summary

DC-C - INFORMATION SUMMARY	
Stream Name	Unnamed stream—DC-C
	WRIA ID #
	07-0396
	Jurisdiction for Portion of Stream in Study Area
	King County
	King County/WDNR Stream Type
	Type N/seasonal
	King County Buffer Width
	65 feet
Location of Stream Relative to Project	The stream is located directly below and adjacent to SR 18 westbound lanes at the toe of slope. Stream DC-C flows from Wetland DC-06 to Wetland DC-03.
Connectivity (where stream flows from/to)	Stream DC-C has seasonal flows originating from hillside seeps and roadway runoff from SR 18. The channel is approximately 4 to 8 feet wide and appears to have been excavated, possibly for an old road. The channel has a sorted gravel bottom and has not been maintained for a very long time. The creek flows subsurface from Wetland DC-06, parallels westbound SR 18, flowing north down a moderate and then steep slope before discharging into Wetland DC-03 at the base of road fill prism, and eventually discharges to Deep Creek. Stream DC-C extends uphill to the south and out of the study area.
Fish Presence	Stream DC-C is a steep stream that discharges into Wetland DC-03. Within Wetland DC-03 there is no defined or continuous channel, which is assumed to limit fish access from Deep Creek into Stream DC-C.
Habitat	The creek is channelized along the toe of slope of westbound SR 18. It lacks riffle/pool complexes and channel migration or meanders. Substrates are small and large cobble and gravel. Overhanging coniferous and deciduous trees and shrubs contribute organic matter, limited amounts of woody debris, and shade.
Riparian/Buffer Condition	The west buffer is undisturbed forested upland. The east side is the road prism of SR 18, where the lower slope is forested and the upper portions are mowed and disturbed by road maintenance activities.

Table 61. Stream DC-D Summary

STREAM DC-D - INFORMATION SUMMARY		
Stream Name	Unnamed stream—Stream DC-D	
	WRIA ID #	07-0396
	Jurisdiction for Portion of Stream in Study Area	King County/WDNR
	WDNR Stream Type	Assumed type F, perennial
	King County Buffer Width	165 feet
Location of Stream Relative to Project	Stream DC-D enters the LB of Deep Creek approximately 75 feet upstream of the SR 18 crossing of Deep Creek.	
Connectivity (where stream flows from/to)	Stream DC-D originates in wetland areas (Wetland DC-01) at the base of the slope on the south side of SR 18 between the main stem of Deep Creek and SR 18.	
Fish Presence	No salmonids are documented in this small unnamed tributary to Deep Creek, and habitat conditions likely limit use by salmonids; however, due to its connection to Deep Creek and lack of barriers, fish presence is assumed.	
Habitat	The stream is low gradient and largely fed by groundwater inputs from adjacent wetlands. Flow is likely perennial; however, the volume of flow appears to be fairly low. It lacks riffle/pool complexes and slow glide habitat is dominant. Overhanging shrubs contribute organic matter, small amounts of woody debris, and shade on both sides of the creek. Substrates are dominated by fines, including sand and silt with sporadic patches of small gravel.	
Riparian/Buffer Condition	Riparian width on the north side of the stream is approximately 75 to 100 feet wide and transitions from wetland vegetation in proximity to the stream (salmonberry, American skunk-cabbage, common lady fern, fringe cup, and horsetail) to mixed coniferous/deciduous forest on the slope leading up to SR 18. Forest vegetation consists of Sitka spruce, western red cedar, red alder and bigleaf maple with an understory of vine maple, western swordfern, salmonberry, and cascara buckthorn. The riparian habitat is similar on the south side of the stream; however, the riparian habitat is uninterrupted.	

Table 62. Stream DC-E Summary

STREAM DC-E - INFORMATION SUMMARY			
Stream Name		Unnamed stream—Stream DC-E	
	WRIA ID #	07-0396	
	Jurisdiction for Portion of Stream in Study Area	King County	
	WDNR Stream Type	Type F assumed, seasonal	
	King County Buffer Width	165 feet	
Location of Stream Relative to Project		The stream is located directly adjacent to SR 18 eastbound lanes at toe of slope. Stream DC-E is a tributary to Deep Creek and enters the RB of Deep Creek approximately 50 feet upstream of the Deep Creek Crossing of SR 18.	
Connectivity (where stream flows from/to)		The creek has seasonal flows originating from two sources. Surface water flows out of a wetland east of SR 18 and contributes flows to this creek. A second hydrologic input is roadway runoff from SR 18 that discharges to Stream DC-E. The creek parallels eastbound SR 18 flowing south and empties into Deep Creek just upstream of the Deep Creek culvert under SR 18 (Figure 8; Appendix A). The lower 35 to 40 feet of stream is contained within an approximate 18-inch diameter corrugated metal pipe culvert.	
Fish Presence		No fish were observed within the fairly short section of stream that contained perennial flow above the confluence with Deep Creek; however, given that Deep Creek does support salmonid use and the fact that the culvert does not appear to be a complete blockage, it is likely that under some flow conditions, salmonids may have access to Stream DC-E.	
Habitat		The creek is generally channelized at the toe of slope of eastbound SR 18. It lacks riffle/pool complexes and channel migration or meanders. Substrates are small cobble and gravel in the lower reach that transitions into patchy areas of small/large gravel and areas of bare soil. Overhanging coniferous and deciduous trees and shrubs contribute organic matter, limited amounts of woody debris, and shade.	
Riparian/Buffer Condition		Riparian vegetation is generally intact on the east side of Stream DC-E and consists of mature forested vegetation in wetlands east of SR 18.	

Table 63. Stream DC-F Summary

STREAM DC-F - INFORMATION SUMMARY			
Stream Name		Unnamed stream—Stream DC-F	
		WRIA ID #	07-0396
		Jurisdiction for Portion of Stream in Study Area	King County
		WDNR Stream Type	Type N, seasonal
		King County Buffer Width	65 feet
Location of Stream Relative to Project		The stream originates directly adjacent to SR 18 westbound lanes at toe of slope in Wetland DC-07. Stream DC-F is a tributary to Deep Creek and enters Deep Creek off site.	
Connectivity (where stream flows from/to)		The creek has seasonal flows originating from two sources. Surface water flows out of Wetland DC-07 west of SR 18 contributes flows to this creek. A second hydrologic input is roadway runoff from SR 18 that discharges to Stream DC-F. The creek parallels westbound SR 18 flowing north, through a culvert under SR 18, through Wetland DC-08 and is assumed to empty into Deep Creek outside of the project area (Figure 8; Appendix A).	
Fish Presence		WDFW habitat survey upstream and downstream of culvert conveying Stream DC-F notes non fish bearing due to physical barrier of scour both upstream and downstream of the culvert (2019). No signs of fish presence during field visit.	
Habitat		The creek is 3-feet wide and generally channelized at the toe of slope of eastbound SR 18. It lacks riffle/pool complexes and channel migration or meanders. Substrates are small cobble and gravel in the lower reach that transitions into patchy areas of small/large gravel and areas of bare soil. Overhanging coniferous and deciduous trees and shrubs contribute organic matter, limited amounts of woody debris, and shade.	
Riparian/Buffer Condition		Riparian vegetation is generally intact on the east side of Stream DC-F and consists of mature forested vegetation and wetland vegetation east and west of SR 18.	

Chapter 5. Sensitive Plants, Fish and Wildlife

An individual Biological Assessment (BA), *I-90/SR 18 Interchange to Deep Creek – Widening and Interchange Improvements Biological Assessment (2019)*, has been completed as part of this project to address project area Endangered Species Act (ESA)-listed species and species protected by Essential Fish Habitat (EFH) under the Magnuson-Stevens Fisheries Conservation and Management Act.

Plants

The WDNR Natural Heritage Information System has no record of any rare plants or high quality ecosystems in the study area (2019). State or federally listed plant species were not identified in the field during the wetland study.

Wildlife and Priority Habitat Species

Three species of fish that are listed under the ESA have been documented in the study area (Table 64). Chinook salmon from the Puget Sound evolutionarily significant unit (ESU) and steelhead from the Puget Sound distinct population segment (DPS) have been documented in the study area in Lake Creek, Raging River, and Deep Creek (WDFW 2018a, 2018b). Bull trout are known to occur in the Snoqualmie River watershed and are presumed to occur within Deep Creek, the Raging River, and Lake Creek (WDFW 2018a). Critical habitat for Puget Sound Chinook salmon has been designated in both the Raging River and Deep Creek within the study area. Critical habitat for Puget Sound steelhead has been designated in Deep Creek, the Raging River, and Lake Creek within the study area. The study area does not include any critical habitat for bull trout.

ESA-listed terrestrial wildlife species potentially occurring within the project vicinity include marbled murrelet, northern spotted owl, and yellow-billed cuckoo.

Table 64. Federally Listed Species Documented or Potentially Occurring within the Project Area.

Common Name	Scientific Name	ESA Status ^a	Occurrence	Critical Habitat
Bull trout	<i>Salvelinus confluentus</i>	Threatened	Documented	Designated
Marbled murrelet	<i>Brachyramphus marmoratus</i>	Threatened	Potential	Designated
Northern spotted owl	<i>Strix occidentalis caurina</i>	Threatened	Potential	Designated
Puget Sound ESU Chinook salmon	<i>Oncorhynchus tshawytscha</i>	Threatened	Documented	Designated
Puget Sound DPS steelhead	<i>Oncorhynchus mykiss</i>	Threatened	Documented	Designated
Yellow-billed cuckoo	<i>Coccyzus americanus</i>	Threatened	Potential	Designated

^a USFWS 2018 and NOAA 2020

Western toad, a Washington state candidate species, was observed during wetland and stream investigations along Stream LC-B and within Wetlands LC-27 and LC-28. They are also documented beyond the study area in Echo Lake (WDFW 2018b, 2018c).

The WDFW Priority Habitats and Species Information shows that Green/Cedar River winter elk range is documented within the southeast quadrant of the project and that wetlands are present adjacent to and near the study area (WDFW 2018b).

None of the wetlands in the project occur in a section, township, and range identified by the WDNR Natural Heritage Program to contain Natural Heritage Features associated with wetlands (WDNR 2018b); however, Wetland LC-04 contains mature forested habitat according to the Washington State Wetland Rating System for Western Washington—Revised (Hruby 2014).

Priority Habitats

All wetlands, by definition, are Priority aquatic habitats. Several wetlands meet the definition of riparian habitat and portions of some wetlands meet the definition of instream habitat, as described by WDFW PHS Program (WDFW 2008).

Special aquatic sites

Pool and riffle development is present throughout the study area of Raging River and the wetlands provide fine sediment that may be suitable for spawning. Both upstream and downstream sections of Deep Creek include several large logjams with multiple pieces of large woody material (LWM), which increases habitat complexity. The Raging River has several boulders but no LWM present. LWM is absent in Lake Creek within the study area, largely due to the presence of two well-established beaver dams. Small woody debris is present in some of the tributaries to Lake Creek, the Raging River, and Deep Creek.

Appendix B. Precipitation Data

Monthly Precipitation data prior to October 31, 2011 at the Landsburg Weather Station

Long-term rainfall records ^a				Recent rainfall records ^b				
Month	3 yrs in 10 less than	Average	3 yrs in 10 more than	Rainfall	Conditions (Dry Wet Normal)	Condition Value	Month Weight Value	Product of Condition*Weight
Oct	2.95	4.79	5.73	6.81	Wet	3	3	9
Sept	1.08	2.70	3.28	2.00	Normal	2	2	4
Aug	0.89	1.63	1.98	0.64	Dry	1	1	1

a. NRCS 2002.

Sum

14

b. NOAA 2012.

c. Conditions are considered normal if they fall within the low and high range around the average

Condition
value:

Note: if the sum is

6-9 then period has been drier than normal

Dry (D) = 1

10-14 then period has been normal

Normal (N) = 2

15-18 then period has been wetter than normal

Wet (W) = 3

Conclusions: *Normal* precipitation conditions were present prior to the field visits in October, 2011.

Precipitation for October, 2011

Date (2011)	Daily Precipitation (inches) ^a
Oct 30	0.53
Oct 29	0.00

Appendix C. Data Forms

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project Site: I-90/SR 18 Interchange - Westbound Flyover Ramp City/County: /King Sampling Date: 10/31/2011
 Applicant/Owner: Washington State Department of Transportation State: WA Sampling Point: W1-SP1
 Investigator(s): D. Littauer, A. Gross Section, Township, Range: S11, T23N, R7E
 Landform (hillslope, terrace, etc.): hillslope Local relief (concave, convex, none): concave Slope (%): 5
 Subregion (LRR): A Lat: 47.498 Long: -121.886 Datum: NAD 83 Harn
 Soil Map Unit Name: Tokul gravelly loam, 15 to 30 percent slopes NWI classification: PFO
 Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☒ No ☐ (If no, explain in Remarks.)
 Are Vegetation ☐, Soil ☐, or Hydrology ☐, significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐
 Are Vegetation ☐, Soil ☐, or Hydrology ☐, naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>
Hydric Soil Present?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>		
Wetland Hydrology Present?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>		
Remarks:

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project Site: I-90/SR 18 Interchange - Westbound Flyover Ramp City/County: /King Sampling Date: 10/31/2011
 Applicant/Owner: Washington State Department of Transportation State: WA Sampling Point: W2-SP2
 Investigator(s): D.Littauer, A. Gross Section, Township, Range: S11, T23N, R7E
 Landform (hillslope, terrace, etc.): hillslope Local relief (concave, convex, none): concave Slope (%): 15
 Subregion (LRR): A Lat: 47.499 Long: -121.886 Datum: NAD 83 Harn
 Soil Map Unit Name: Tokol gravelly loam, 15 to 30 percent slopes NWI classification: upland
 Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☒ No ☐ (If no, explain in Remarks.)
 Are Vegetation ☐, Soil ☐, or Hydrology ☐, significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐
 Are Vegetation ☐, Soil ☐, or Hydrology ☐, naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Hydric Soil Present?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>		
Wetland Hydrology Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>		
Remarks: This upland data point was taken very near the wetland boundary to document the difference between upland and wetland conditions and show how the wetland determination was made. See remarks in the vegetation and soils sections for further explanation of why those factors are present but that this point is in an upland area.			

VEGETATION – Use scientific names of plants

 Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☒ No ☐ (If no, explain in Remarks.)
 Are Vegetation ☐, Soil ☐, or Hydrology ☐, significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐
 Are Vegetation ☐, Soil ☐, or Hydrology ☒, naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>
Hydric Soil Present?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>		
Wetland Hydrology Present?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>		
Remarks: The naturally problematic box for hydrology is checked because wetland hydrology indicators were not present during time of fieldwork, but are likely present during the early part of the growing season. Due to the presence of the other two factors, the landscape position, topography, and the field work occurring at the end of the growing season, wetland hydrology is assumed present.

WETLAND DETERMINATION DATA FORM - Western Mountains, Valleys, and Coast Region

Project/Site: SR 18/I-90 Interchange - Westbound Flyover Ramp City/County: King Sampling Date: 22-Oct-12
 Applicant/Owner: WSDOT State: WA Sampling Point: w5-sp1
 Investigator(s): Tatiana Dreisbach/Beth Toberer Section, Township, Range: S 2 T 23N R 7E
 Landform (hillslope, terrace, etc.): depression Local relief (concave, convex, none): concave Slope: 5.0 % / 2.9 °
 Subregion (LRR): LRR A Lat.: 47.505 Long.: -121.886 Datum: NAD83HARN
 Soil Map Unit Name: Tokul gravelly loam, 15% to 30% slopes NWI classification: PSS

Are climatic/hydrologic conditions on the site typical for this time of year? Yes ☒ No ☐ (If no, explain in Remarks.)
 Are Vegetation ☒ , Soil ☒ , or Hydrology ☐ significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐
 Are Vegetation ☐ , Soil ☐ , or Hydrology ☐ naturally problematic? (If needed, explain any answers in Remarks.)

Summary of Findings - Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="radio"/> No <input type="radio"/>	Is the Sampled Area within a Wetland? Yes <input checked="" type="radio"/> No <input type="radio"/>
Hydric Soil Present? Yes <input checked="" type="radio"/> No <input type="radio"/>	
Wetland Hydrology Present? Yes <input checked="" type="radio"/> No <input type="radio"/>	
Remarks: This wetland area is forming in excavated/disturbed WSDOT maintenance yard. Soils have been excavated and vegetation cleared and these factors are considered significantly disturbed. Excavation of soils may have inadvertently resulted in the establishment of this newly forming wetland. It is adjacent to W4. It may have been excavated in upland or maybe historic wetland given close proximity to W4.	

VEGETATION - Use scientific names of plants.

% Bare Ground in Herb Stratum: <u>76</u>				
Remarks: - in the Indicator Status column indicates the species is unknown. The inflorescence on both the Carex species and Salix species were not present and therefore the plants were not identifiable to species. Given that all of the species in this location except one are wetland species and that the soils and hydrology meet wetland criteria, the Carex and Salix species are likely a wetland species. The Salix species is not a dominant so its indicator status does not affect the dominance test calculation. The Carex species is included in the dominance calculation as a FAC or wetter plant. If the Carex was counted as an upland plant, the dominance test would still be met.

Hydric Soil Present? Yes ☒ No ☐

Remarks: This wetland is in a disturbed area on a WSDOT maintenance yard. The area appears to have been relatively recently excavated and is a newly forming wetland. Soils are bright and don't meet an indicator, however, they are still hydric soils and this is why the "other" box is checked. Soils meet the definition of hydric soils: ponding and saturation for long periods during the growing season. The presence of wetland hydrology and a hydrophytic plant community also indicate that the soils are wetland soils.

Hydrology

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- | | |
|--|---|
| <input type="checkbox"/> Surface Water (A1) | <input type="checkbox"/> Water-Stained Leaves (B9) (except MLRA 1, 2, 4A, and 4B) |

0 = Total Cover				
% Bare Ground in Herb Stratum: <u>55</u>				
Remarks: - in the Indicator Status column indicates the species is unknown. The inflorescence on the Carex species was not present and therefore the plant was not identifiable to species. Given that all except one of the species in this location are wetland species and that the soils and hydrology meet wetland criteria, the Carex species is likely a wetland species. The Carex species is included as a FAC or wetter species in the dominance test calculation. If it were excluded from the dominance calculation it would not be met but the prevalence index would still be met if the Carex species is counted as a FAC plant.				

Sampling Point: w6-sp1

% Bare Ground in Herb Stratum: <u>1</u>				
Remarks: - in the Indicator Status column indicates the species is unknown. The inflorescence on the Salix species was not present and therefore the plant was not identifiable to species. Given that all but two of the species in this location are wetland species and that the soils and hydrology meet wetland criteria, the Salix species is likely a wetland species. The Salix species is included in the dominance calculation as a FAC or wetter plant. If the Salix species was excluded from the dominance calculation, the dominance text would still be met.				

Sampling Point: w7-sp1

Describe Recorded Data (stream gauge, monitor well, aerial photos, previous inspections), if available:

heavy rain for two hours prior to delineation.

This upland sample point is 12 inches higher in elevation than the wetland sample point W8-SP1. This area has direct observation of water on this field visit due to heavy rains occurring in the past 24 hours. Due to landscape position and upland soils this area is assumed to not have wetland hydrology present, despite the presence of water in the upland plot during heavy precipitation event.

Remarks: Drier than normal precipitation conditions were present prior to the October 3, 2012 field work (Appendix A-1), indicating hydrology is naturally problematic during this field visit. Wetland hydrology is assumed to be present during periods with normal precipitation. Wetland formed on top of restricted soil layer of that perches water during the growing season.	

VEGETATION - Use scientific names of plants.

Field Observations:

Surface Water Present? Yes ☐ No ☒Depth (inches): Water Table Present? Yes ☐ No ☒Depth (inches): Saturation Present? (includes capillary fringe) Yes ☐ No ☒Depth (inches): Wetland Hydrology Present? Yes ☒ No ☐

Describe Recorded Data (stream gauge, monitor well, aerial photos, previous inspections), if available:

Remarks:

Drier than normal precipitation conditions were present prior to the October 3, 2012 field work (Appendix A-1). Wetland hydrology is presumed present during periods with normal precipitation in this location given the vegetation community dominated by hydrophytic plants and the presence of hydric soils. Precipitation likely driven by precipitation and run-on which perches on the restrictive layer. Wetland is in MLRA 2 so water-stained leaves are a secondary indicator.

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

WETLAND DETERMINATION DATA FORM - Western Mountains, Valleys, and Coast Region

Project/Site: SR 18/I-90 Interchange - Westbound Flyover Ramp City/County: King Sampling Date: 18-Sep-12
 Applicant/Owner: WSDOT State: WA Sampling Point: w14-sp1
 Investigator(s): Tatiana Dreisbach/Beth Toberer Section, Township, Range: S 2 T 23N R 7E
 Landform (hillslope, terrace, etc.): depression Local relief (concave, convex, none): concave Slope: 10.0 % / 5.7 °
 Subregion (LRR): LRR A Lat.: 47.51 Long.: -121.88 Datum: NAD83HARN
 Soil Map Unit Name: Tokul gravelly loam, 15% to 30% slopes NWI classification: PFO

Are climatic/hydrologic conditions on the site typical for this time of year? Yes ☒ No ☐ (If no, explain in Remarks.)
 Are Vegetation ☐ , Soil ☐ , or Hydrology ☐ significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐
 Are Vegetation ☐ , Soil ☐ , or Hydrology ☐ naturally problematic? (If needed, explain any answers in Remarks.)

Summary of Findings - Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="radio"/> No <input type="radio"/>	Is the Sampled Area within a Wetland? Yes <input checked="" type="radio"/> No <input type="radio"/>
Hydric Soil Present? Yes <input checked="" type="radio"/> No <input type="radio"/>	
Wetland Hydrology Present? Yes <input checked="" type="radio"/> No <input type="radio"/>	
Remarks: Two ditches drain to the wetland. One ditch drains from W13, the other drains from the east. Both ditches parallel I-90. Both ditches meet in a closed depressional area at the lowest point of this wetland.	

VEGETATION - Use scientific names of plants.

% Bare Ground in Herb Stratum: <u>40</u>				
Remarks: - in the Indicator Status column indicates the species is unknown. The inflorescence on the Carex species was not present and therefore the plant was not identifiable to species. Given that all of the species in this location are wetland species and that the soils and hydrology meet wetland criteria, the Carex species is likely a wetland species. The Carex species is not a dominant so its indicator status does not affect the dominance test calculation.

Summary of Findings - Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="radio"/> No <input type="radio"/>	Is the Sampled Area within a Wetland? Yes <input type="radio"/> No <input checked="" type="radio"/>
Hydric Soil Present? Yes <input type="radio"/> No <input checked="" type="radio"/>	
Wetland Hydrology Present? Yes <input type="radio"/> No <input checked="" type="radio"/>	
Remarks: Drier than normal precipitation conditions were present prior to the September 24, 2012 field work (Appendix A-1), indicating hydrology is naturally problematic during this field visit. This upland data point is characteristic of some other upland areas in the project which are dominated by <i>Spiraea douglasii</i> . These upland areas at a glance may look like possible wetlands, however they are usually on slopes and do not retain water for long enough periods to support wetland hydrology. They also have upland and FAC species in the understory such as <i>Rubus ursinus</i> and <i>Holcus lanatus</i> and lack hydric soils.	

VEGETATION - Use scientific names of plants.

- ☐ Water-Stained Leaves (B9) (except MLRA 1, 2, 4A, and 4B)
☐ Salt Crust (B11)
☐ Aquatic Invertebrates (B13)
☐ Hydrogen Sulfide Odor (C1)
☐ Oxidized Rhizospheres on Living Roots (C3)
☐ Presence of Reduced Iron (C4)
☐ Recent Iron Reduction in Tilled Soils (C6)
☐ Stunted or Stressed Plants (D1) (LRR A)
☐ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- ☒ Water-Stained Leaves (B9) (MLRA 1, 2, 4A, and 4B)
☐ Drainage Patterns (B10)
☐ Dry Season Water Table (C2)
☐ Saturation Visible on Aerial Imagery (C9)
☐ Geomorphic Position (D2)
☐ Shallow Aquitard (D3)
☐ FAC-neutral Test (D5)
☐ Raised Ant Mounds (D6) (LRR A)
☐ Frost Heave Hummocks (D7)

Field Observations:

Surface Water Present? Yes ☐ No ☒Depth (inches): Water Table Present? Yes ☐ No ☒Depth (inches): Saturation Present? (includes capillary fringe) Yes ☒ No ☐Depth (inches): Wetland Hydrology Present? Yes ☒ No ☐

Describe Recorded Data (stream gauge, monitor well, aerial photos, previous inspections), if available:

Remarks:

Wetland is an open depression with constricted outlet with drainage patterns draining to jurisdictional ditch. Wetland is in MLRA 2 so water-stained leaves are a secondary indicator.

Primary Indicators (minimum of one required; check all that apply)

Secondary Indicators (minimum of two required)

- ☐ Water-Stained Leaves (B9) (MLRA 1, 2, 4A, and 4B)
- ☐ Drainage Patterns (B10)
- ☐ Dry Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-neutral Test (D5)
- ☐ Raised Ant Mounds (D6) (LRR A)
- ☐ Frost Heave Hummocks (D7)

Surface Water Present? Yes ☐ No ☒

Water Table Present? Yes ☐ No ☒

Saturation Present?
(includes capillary fringe) Yes ☐ No ☒

Depth (inches):

Depth (inches):

Depth (inches):

Wetland Hydrology Present? Yes ☒ No ☐

Describe Recorded Data (stream gauge, monitor well, aerial photos, previous inspections), if available:

soil moist 0-12 in. oxidized rhizospheres throughout top layer.

Though drier than normal conditions were present during the time of the field visit, and direct observation of water was not present, other wetland hydrology indicators were present indicating wetland hydrology is present.

WETLAND DETERMINATION DATA FORM - Western Mountains, Valleys, and Coast Region

Project/Site: SR 18/I-90 Interchange - Westbound Flyover Ramp City/County: King Sampling Date: 24-Sep-12
 Applicant/Owner: WSDOT State: WA Sampling Point: w18-sp2
 Investigator(s): Tatiana Dreisbach/Beth Toberer Section, Township, Range: S 2 T 23N R 7E
 Landform (hillslope, terrace, etc.): Hillside Local relief (concave, convex, none): concave Slope: 10.0 % / 5.7 °
 Subregion (LRR): LRR A Lat.: 47.511 Long.: -121.873 Datum: NAD83HARN
 Soil Map Unit Name: Tokul gravelly loam, 15% to 30% slopes NWI classification: Upland

Are climatic/hydrologic conditions on the site typical for this time of year? Yes ☐ No ☒ (If no, explain in Remarks.)
 Are Vegetation ☐ , Soil ☐ , or Hydrology ☐ significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐
 Are Vegetation ☐ , Soil ☐ , or Hydrology ☒ naturally problematic? (If needed, explain any answers in Remarks.)

Summary of Findings - Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="radio"/> No <input type="radio"/>	Is the Sampled Area within a Wetland? Yes <input type="radio"/> No <input checked="" type="radio"/>
Hydric Soil Present? Yes <input type="radio"/> No <input checked="" type="radio"/>	
Wetland Hydrology Present? Yes <input type="radio"/> No <input checked="" type="radio"/>	
Remarks: Drier than normal precipitation conditions were present prior to the September 24, 2012 field work (Appendix A-1), indicating hydrology is naturally problematic during this field visit.	

VEGETATION - Use scientific names of plants.

Remarks: - in the Indicator Status column indicates the species is unknown. The inflorescence on the Carex species was not present and therefore the plant was not identifiable to species. Given that all of the species in this location are wetland species and that the soils and hydrology meet wetland criteria, the Carex species is likely a wetland species. The Carex species is not a dominant so its indicator status does not affect the dominance test calculation.

Depth (inches):

Water Table Present? Yes ☐ No ☒

Depth (inches):

Saturation Present? (includes capillary fringe) Yes ☐ No ☒

Depth (inches):

Wetland Hydrology Present? Yes ☒ No ☐

Describe Recorded Data (stream gauge, monitor well, aerial photos, previous inspections), if available:

Remarks:

Though drier than normal conditions were present during the time of the field visit, and direct observation of water was not present, other wetland hydrology indicators were present indicating wetland hydrology is present. Soils moist throughout soil profile to 23 inches at the end of the dry season. Wetland is in a forested gully and likely has a highwater table and may convey surface water during and following precipitation events.

Indicators for Problematic Hydric Soils³:

- ☐ 2 cm Muck (A10)
☐ Red Parent Material (TF2)
☐ Very Shallow Dark Surface (TF12)
☒ Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: _____
 Depth (inches): _____

Hydric Soil Present? Yes ☒ No ☐

Remarks: SP-7(WET) meets for wetland criteria due the presence of wetland hydrology and vegetation and the presence of problematic hydric soils (freshly deposited alluvium lacks time to develop color characteristics of indicators) found on site. Refer to USACE Regional Supplement page 102 section C, "Soils may lack hydric soil indicators in recently deposited materials (i.e., Entisols) even when indicators of hydrophytic vegetation and wetland hydrology are present...." At this SP, hydrophytic vegetation meets wetland criteria as well as wetland hydrology with a water table present at 11 inches and saturation within the upper 10 inches. This observation was made at flows well below (1-2 feet) ordinary high water elevations.

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: I-90/SR 18 Interchange & Weigh Station Design Services City/County: King County Sampling Date: 8/22/18
 Applicant/Owner: WSDOT State: WA Sampling Point: 9(UPL)
 Investigator(s): Josh Wozniak, Trey Parry Section, Township, Range: S11 R7E T23N
 Landform (hillslope, terrace, etc.): terrace Local relief (concave, convex, none): concave Slope (%): <1
 Subregion (LRR): A Lat: 47.500092 Long: -121.885000 Datum: WGS-84
 Soil Map Unit Name: Tokul gravelly medial loam NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☐ No ☒ (If no, explain in Remarks.)

Are Vegetation no, Soil no, or Hydrology no significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐

Are Vegetation no, Soil no, or Hydrology no naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Hydric Soil Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	
Wetland Hydrology Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	
Remarks: SP-9 (UPL) the associated upland plot of Wetland 28. SP-9 (UPL) is located in forest with legacy large downed wood, resulting in diverse microtopography such as hummocks, supporting sword fern, etc. The WETS table indicates that conditions have been drier than normal for the previous three months.	

VEGETATION – Use scientific names of plants.

Remarks: No saturation or groundwater table was observed within the excavated depth of 24 inches.

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: I-90/SR 18 Interchange & Weigh Station Design Services City/County: King County Sampling Date: 8/22/18
 Applicant/Owner: WSDOT State: WA Sampling Point: 12(WET)
 Investigator(s): Trey Parry, Steve Krueger Section, Township, Range: S02 R7E T23N
 Landform (hillslope, terrace, etc.): terrace Local relief (concave, convex, none): none Slope (%): 2
 Subregion (LRR): A Lat: 47.504016 Long: -121.884885 Datum: WGS-84
 Soil Map Unit Name: Tokul gravelly medial loam NWI classification: R3UBH

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☐ No ☒ (If no, explain in Remarks.)

Are Vegetation no, Soil no, or Hydrology no significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐

Are Vegetation no, Soil no, or Hydrology no naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>
Hydric Soil Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	
Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	
Remarks: SP-12 (WET) is associated with Wetland 4. SP-12 (WET) is positioned below the OHWM of Lake Creek near the scour pool of the culverts downstream of SR-18. A lot of beaver activity was observed in this location. The WETS table indicates that conditions have been drier than normal for the previous three months.	

VEGETATION – Use scientific names of plants.

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: I-90/SR 18 Interchange & Weigh Station Design Services City/County: King County Sampling Date: 8/15/18
 Applicant/Owner: WSDOT State: WA Sampling Point: 21(UPL)
 Investigator(s): Josh Wozniak, Trey Parry Section, Township, Range: S02 R7E T23N
 Landform (hillslope, terrace, etc.): hillslope Local relief (concave, convex, none): concave Slope (%): 4
 Subregion (LRR): A Lat: 47.503645 Long: -121.884364 Datum: WGS-84
 Soil Map Unit Name: Tokul gravelly medial loam NWI classification: R5UBH

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☐ No ☒ (If no, explain in Remarks.)

Are Vegetation no, Soil no, or Hydrology no significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐

Are Vegetation no, Soil no, or Hydrology no naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Hydric Soil Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	
Wetland Hydrology Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	
Remarks: SP-21 (UPL) is the paired upland plot for SP-20 (WET) and the associated upland plot of Wetland 28. SP-21 (UPL) is positioned in uplands adjacent to Stream 3 and Wetland 28. This area has been logged in the past and has mature trees (approximately 60-80 years) overhead. The WETS table indicates that conditions have been drier than normal for the previous three months.	

VEGETATION – Use scientific names of plants.

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: I-90/SR 18 Interchange & Weigh Station Design Services City/County: King County Sampling Date: 10/24/18
 Applicant/Owner: WSDOT State: WA Sampling Point: 33(UPL)
 Investigator(s): Jeff Meyer, Trey Parry Section, Township, Range: S03 R7E T23N
 Landform (hillslope, terrace, etc.): hillslope Local relief (concave, convex, none): none Slope (%): 0-1
 Subregion (LRR): A Lat: 47.505169 Long: -121.887405 Datum: WGS-84
 Soil Map Unit Name: Tokul gravelly medial loam NWI classification: none

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☒ No ☐ (If no, explain in Remarks.)

Are Vegetation no, Soil no, or Hydrology no significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐

Are Vegetation no, Soil no, or Hydrology no naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Hydric Soil Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	
Wetland Hydrology Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	
Remarks: SP-33 (UPL) is the paired upland plot for SP-29 (WET) and the associated upland plot of Wetland 32. SP-33 (UPL) is located on an upland ridge near the wetland boundary. The WETS table indicates that hydrologic conditions have been normal for the previous three months.	

VEGETATION – Use scientific names of plants.

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: I-90/SR 18 Interchange & Weigh Station Design Services City/County: King County Sampling Date: 10/24/18
 Applicant/Owner: WSDOT State: WA Sampling Point: 35(UPL)
 Investigator(s): Jeff Meyer, Trey Parry Section, Township, Range: S03 R7E T23N
 Landform (hillslope, terrace, etc.): hillslope Local relief (concave, convex, none): none Slope (%): 0-1
 Subregion (LRR): A Lat: 47.508747 Long: -121.890059 Datum: WGS-84
 Soil Map Unit Name: Tokul gravelly medial loam NWI classification: none

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☒ No ☐ (If no, explain in Remarks.)

Are Vegetation no, Soil no, or Hydrology no significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐

Are Vegetation no, Soil no, or Hydrology no naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Hydric Soil Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	
Wetland Hydrology Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	
Remarks: SP-35 (UPL) is the paired plot for SP-34 (WET) and the associated upland plot of Wetland 33. The WETS table indicates that hydrologic conditions have been normal for the previous three months.	

VEGETATION – Use scientific names of plants.

---	---

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks: Oxidized rhizospheres present.

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: I-90/SR 18 Interchange & Weigh Station Design Services City/County: King County Sampling Date: 10/24/18
 Applicant/Owner: WSDOT State: WA Sampling Point: 45(WET)
 Investigator(s): Jeff Meyer, Trey Parry Section, Township, Range: S15 R7E T23N
 Landform (hillslope, terrace, etc.): depression Local relief (concave, convex, none): concave Slope (%): 0-1
 Subregion (LRR): A Lat: 47.481333 Long: -121.889374 Datum: WGS-84
 Soil Map Unit Name: Tokul gravelly medial loam NWI classification: none

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☒ No ☐ (If no, explain in Remarks.)

Are Vegetation no, Soil no, or Hydrology no significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐

Are Vegetation no, Soil no, or Hydrology no naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>
Hydric Soil Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	
Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	
Remarks: SP-45 (WET) is associated with Wetland 23. SP-45 (WET) is positioned in a swale-like depression that is hydrologically connected to the "WSDOT converted stream". The WETS table indicates that hydrologic conditions have been normal for the previous three months.	

VEGETATION – Use scientific names of plants.

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available: N/A

Remarks:

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: I-90/SR 18 Interchange & Weigh Station Design Services City/County: King County Sampling Date: 11/14/18
 Applicant/Owner: WSDOT State: WA Sampling Point: 51(WET)
 Investigator(s): Trey Parry, Kaylee Moser Section, Township, Range: S02, T23N, R7E
 Landform (hillslope, terrace, etc.): Hillslope Local relief (concave, convex, none): None Slope (%): 2-3
 Subregion (LRR): A Lat: 47.510168 Long: -121.876014 Datum: WGS84
 Soil Map Unit Name: Tokul gravelly medial loam NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☒ No ☐ (If no, explain in Remarks.)

Are Vegetation No, Soil No, or Hydrology No significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐

Are Vegetation No, Soil No, or Hydrology No naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>
Hydric Soil Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	
Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	
Remarks: SP-51 (WET) is associated with Wetland 16. SP-51 (WET) is positioned on an old service road on the I-90 cutbank. Disturbed site that was likely artificially compacted during the I-90 construction process.	

VEGETATION – Use scientific names of plants.

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: I-90/SR 18 Interchange and Weigh/Inspection Station City/County: King County Sampling Date: 6/20/2019
 Applicant/Owner: Washington State Department of Transportation State: WA Sampling Point: W41-SP2
 Investigator(s): Ryan Boyle and Jennie Husby Section, Township, Range: S02, T23N, R7E
 Landform (hillslope, terrace, etc.): hillslope Local relief (concave, convex, none): none Slope (%): 3
 Subregion (LRR): A Lat: 47.509287 Long: -121.884193 Datum: NAD83HARN
 Soil Map Unit Name: Tokul gravelly medial loam NWI Classification: PEM

Are climatic / hydrologic conditions on the site typical for this time of year? ☒ Yes ☐ No (If no, explain in Remarks.)
 Are Vegetation ☐ , Soil ☐ , or Hydrology ☐ significantly disturbed? Are "Normal Circumstances" present? ☒ Yes ☐ No
 Are Vegetation ☐ , Soil ☐ , or Hydrology ☒ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? <input checked="" type="radio"/> Yes <input type="radio"/> No Hydric Soil Present? <input checked="" type="radio"/> Yes <input type="radio"/> No Wetland Hydrology Present? <input checked="" type="radio"/> Yes <input type="radio"/> No	Is the Sampled Area within a Wetland? <input checked="" type="radio"/> Yes <input type="radio"/> No
Remarks: Hydrology is naturally problematic due to the site visit occurring during the normal annual dry season. A restrictive soil layer is present within 24 in. of the surface, hydrophytic vegetation, and hydric soils are present. Wetland hydrology is presumed to be present during the wet part of the growing season as conditions 2f. and 3a. (pgs. 116 & 117 USACE 2010) are met for wetlands that periodically lack indicators of wetland hydrology.	

VEGETATION – Use scientific names of plants.

Are climatic / hydrologic conditions on the site typical for this time of year? ☒ Yes ☐ No (If no, explain in Remarks.)
 Are Vegetation ☐ , Soil ☐ , or Hydrology ☐ significantly disturbed? Are "Normal Circumstances" present? ☒ Yes ☐ No
 Are Vegetation ☐ , Soil ☐ , or Hydrology ☒ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? <input checked="" type="radio"/> Yes <input type="radio"/> No	Is the Sampled Area within a Wetland? <input checked="" type="radio"/> Yes <input type="radio"/> No
Hydric Soil Present? <input checked="" type="radio"/> Yes <input type="radio"/> No	
Wetland Hydrology Present? <input checked="" type="radio"/> Yes <input type="radio"/> No	

Remarks:
 Hydrology is naturally problematic due to the site visit occurring during the normal annual dry season. A restrictive soil layer is present within 24 in. of the surface, hydrophytic vegetation, and hydric soils are present. Wetland hydrology is presumed to be present during the wet part of the growing season as conditions 2f. and 3a. (pgs. 116 & 117 USACE 2010) are met for wetlands that periodically lack indicators of wetland hydrology.

VEGETATION – Use scientific names of plants.

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: I-90/SR 18 Interchange and Weigh/Inspection Station City/County: King County Sampling Date: 6/20/2019
 Applicant/Owner: Washington State Department of Transportation State: WA Sampling Point: W42-SP2
 Investigator(s): Ryan Boyle and Jennie Husby Section, Township, Range: S02, T23N, R7E
 Landform (hillslope, terrace, etc.): hillslope Local relief (concave, convex, none): none Slope (%): 1
 Subregion (LRR): A Lat: 47.507428 Long: -121.883542 Datum: NAD83HARN
 Soil Map Unit Name: Tokul gravelly medial loam NWI Classification: upland

Are climatic / hydrologic conditions on the site typical for this time of year? ☒ Yes ☐ No (If no, explain in Remarks.)
 Are Vegetation ☐ , Soil ☐ , or Hydrology ☐ significantly disturbed? Are "Normal Circumstances" present? ☒ Yes ☐ No
 Are Vegetation ☐ , Soil ☐ , or Hydrology ☐ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? <input type="radio"/> Yes <input checked="" type="radio"/> No	Is the Sampled Area within a Wetland? <input type="radio"/> Yes <input checked="" type="radio"/> No
Hydric Soil Present? <input type="radio"/> Yes <input checked="" type="radio"/> No	
Wetland Hydrology Present? <input type="radio"/> Yes <input checked="" type="radio"/> No	
Remarks:

Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

- ☒ **NO** - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

- ☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*
*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

- ☒ **NO** - go to 3 ☐ **YES** - The wetland class is **Flats**
*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

- ☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

- ☒ **NO** - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

- ☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded**.

- ☒ **NO** - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

- ☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

- ☒ **NO** - go to 6 ☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7

☒ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8

☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

DEPRESSIONAL AND FLATS WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality**D 1.0. Does the site have the potential to improve water quality?****D 1.1. Characteristics of surface water outflows from the wetland:**

Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet).

points = 3

Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet.

points = 2

☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing

points = 1

☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch.

points = 1

2

D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions).

Yes = 4 No = 0

4

D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes):

Wetland has persistent, ungrazed, plants > 95% of area

points = 5

Wetland has persistent, ungrazed, plants > 1/2 of area

points = 3

Wetland has persistent, ungrazed plants > 1/10 of area

points = 1

Wetland has persistent, ungrazed plants < 1/10 of area

points = 0

3

D 1.4. Characteristics of seasonal ponding or inundation:*This is the area that is ponded for at least 2 months. See description in manual.*

Area seasonally ponded is > 1/2 total area of wetland

points = 4

Area seasonally ponded is > 1/4 total area of wetland

points = 2

Area seasonally ponded is < 1/4 total area of wetland

points = 0

4

Total for D 1

Add the points in the boxes above

13**Rating of Site Potential** If score is: ☒ 12 - 16 = H ☐ 6 - 11 = M ☐ 0 - 5 = L Record the rating on the first page**D 2.0. Does the landscape have the potential to support the water quality function of the site?****D 2.1. Does the wetland unit receive stormwater discharges?**

Yes = 1 No = 0

1

D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?

Yes = 1 No = 0

1

D 2.3. Are there septic systems within 250 ft of the wetland?

Yes = 1 No = 0

0

D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1 - D 2.3?Source Roadside debris/garbage

Yes = 1 No = 0

1

Add the points in the boxes above

2**Rating of Value** If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

DEPRESSIONAL AND FLATS WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream degradation**D 4.0. Does the site have the potential to reduce flooding and erosion?****D 4.1. Characteristics of surface water outflows from the wetland:**

- | | | |
|---|------------|---|
| Wetland is a depression or flat depression with no surface water leaving it (no outlet) | points = 4 | 2 |
| Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet | points = 2 | |
| Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch | points = 1 | |
| Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing | points = 0 | |

D 4.2. Depth of storage during wet periods: Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.

- | | | |
|---|------------|---|
| Marks of ponding are 3 ft or more above the surface or bottom of outlet | points = 7 | 5 |
| Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet | points = 5 | |
| <input type="checkbox"/> Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet | points = 3 | |
| <input type="checkbox"/> The wetland is a "headwater" wetland | points = 3 | |
| Wetland is flat but has small depressions on the surface that trap water | points = 1 | |
| Marks of ponding less than 0.5 ft (6 in) | points = 0 | |

D 4.3. Contribution of the wetland to storage in the watershed: Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.

- | | | |
|---|------------|---|
| <input type="checkbox"/> The area of the basin is less than 10 times the area of the unit | points = 5 | 5 |
| The area of the basin is 10 to 100 times the area of the unit | points = 3 | |
| The area of the basin is more than 100 times the area of the unit | points = 0 | |
| <input type="checkbox"/> Entire wetland is in the Flats class | points = 5 | |

Total for D 4 Add the points in the boxes above **12****Rating of Site Potential** If score is: ☒ 12 - 16 = H ☐ 6 - 11 = M ☐ 0 - 5 = L Record the rating on the first page**D 5.0. Does the landscape have the potential to support hydrologic function of the site?****D 5.1. Does the wetland unit receive stormwater discharges?** Yes = 1 No = 0 **1****D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff?** Yes = 1 No = 0 **1****D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)?** Yes = 1 No = 0 **0****Total for D 5** Add the points in the boxes above **2****Rating of Landscape Potential** If score is: ☐ 3 = H ☒ 1 or 2 = M ☐ 0 = L Record the rating on the first page**D 6.0. Are the hydrologic functions provided by the site valuable to society?****D 6.1. The unit is in a landscape that has flooding problems. Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.**

- | | | |
|--|------------|---|
| The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds): | | 2 |
| • Flooding occurs in a sub-basin that is immediately down-gradient of unit. | points = 2 | |
| <input type="checkbox"/> • Surface flooding problems are in a sub-basin farther down-gradient. | points = 1 | |
| <input type="checkbox"/> Flooding from groundwater is an issue in the sub-basin. | points = 1 | |
| <input type="checkbox"/> The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why | points = 0 | |
| <input type="checkbox"/> There are no problems with flooding downstream of the wetland. | points = 0 | |

D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0 **0****Total for D 6** Add the points in the boxes above **2****Rating of Value** If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L Record the rating on the first page

These questions apply to wetlands of all HGM classes.**HABITAT FUNCTIONS** - Indicators that site functions to provide important habitat**H 1.0.** Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|--|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 2 |
| <input type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input checked="" type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input checked="" type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input checked="" type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 2 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

**None** = 0 points**Low** = 1 point**Moderate** = 2 points

2

All three diagrams
in this row are
HIGH = 3 points

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i>		4
<input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) <input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland <input type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) <input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>) <input checked="" type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>) <input checked="" type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)		
Total for H 1 Add the points in the boxes above		
Rating of Site Potential If Score is: <input type="checkbox"/> 15 - 18 = H <input checked="" type="checkbox"/> 7 - 14 = M <input type="checkbox"/> 0 - 6 = L Record the rating on the first page		
Rating of Site Potential If Score is: <input type="checkbox"/> 15 - 18 = H <input checked="" type="checkbox"/> 7 - 14 = M <input type="checkbox"/> 0 - 6 = L Record the rating on the first page		

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i> 25 % undisturbed habitat + (20 % moderate & low intensity land uses / 2) = 35%		
If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	3	
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i> 27 % undisturbed habitat + (22 % moderate & low intensity land uses / 2) = 38%		
Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	2	
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0		
Total for H 2 Add the points in the boxes above		5
Rating of Landscape Potential If Score is: <input checked="" type="checkbox"/> 4 - 6 = H <input type="checkbox"/> 1 - 3 = M <input type="checkbox"/> < 1 = L Record the rating on the first page		

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.		
Site meets ANY of the following criteria: points = 2 <input type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input checked="" type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	2	
Rating of Value If Score is: <input checked="" type="checkbox"/> 2 = H <input type="checkbox"/> 1 = M <input type="checkbox"/> 0 = L Record the rating on the first page		

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☒ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☐ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☐ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

- ☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.
- ☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☒ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

- ☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks
- ☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☒ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

- ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).
- ☐ At least $\frac{3}{4}$ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
- ☐ The wetland is larger than $\frac{1}{10}$ ac (4350 ft²)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

- ☐ Long Beach Peninsula: Lands west of SR 103
- ☐ Grayland-Westport: Lands west of SR 105
- ☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☒ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Coastal Lagoon	
Interdunal	
None of the above	X

Maps and Figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	
Hydroperiods	D 1.4, H 1.2	
Location of outlet (<i>can be added to map of hydroperiods</i>)	D 1.1, D 4.1	
Boundary of area within 150 ft of the wetland (<i>can be added to another figure</i>)	D 2.2, D 5.2	
Map of the contributing basin	D 4.3, D 5.3	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	D 3.3	

Riverine Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Ponded depressions	R 1.1	
Boundary of area within 150 ft of the wetland (<i>can be added to another figure</i>)	R 2.4	
Plant cover of trees, shrubs, and herbaceous plants	R 1.2, R 4.2	
Width of unit vs. width of stream (<i>can be added to another figure</i>)	R 4.1	
Map of the contributing basin	R 2.2, R 2.3, R 5.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	R 3.1	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	R 3.2, R 3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	L 1.1, L 4.1, H 1.1, H 1.4	
Plant cover of trees, shrubs, and herbaceous plants	L 1.2	
Boundary of area within 150 ft of the wetland (<i>can be added to another figure</i>)	L 2.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	L 3.1, L 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	L 3.3	

Slope Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Plant cover of dense trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of dense, rigid trees, shrubs, and herbaceous plants (<i>can be added to another figure</i>)	S 4.1	
Boundary of area within 150 ft of the wetland (<i>can be added to another figure</i>)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

- ☒ **NO** - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

- ☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*
*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

- ☒ **NO** - go to 3 ☐ **YES** - The wetland class is **Flats**
*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

- ☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

- ☒ **NO** - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

- ☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded**.

- ☒ **NO** - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

- ☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

- ☒ **NO** - go to 6 ☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7

☒ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8

☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

DEPRESSIONAL AND FLATS WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality**D 1.0. Does the site have the potential to improve water quality?****D 1.1. Characteristics of surface water outflows from the wetland:**

Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet).

points = 3

Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet.

points = 2

☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing

points = 1

☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch.

points = 1

2

D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions).

Yes = 4 No = 0

0

D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes):

Wetland has persistent, ungrazed, plants > 95% of area

points = 5

Wetland has persistent, ungrazed, plants > 1/2 of area

points = 3

Wetland has persistent, ungrazed plants > 1/10 of area

points = 1

Wetland has persistent, ungrazed plants < 1/10 of area

points = 0

5

D 1.4. Characteristics of seasonal ponding or inundation:*This is the area that is ponded for at least 2 months. See description in manual.*

Area seasonally ponded is > 1/2 total area of wetland

points = 4

Area seasonally ponded is > 1/4 total area of wetland

points = 2

Area seasonally ponded is < 1/4 total area of wetland

points = 0

4

Total for D 1

Add the points in the boxes above

11**Rating of Site Potential** If score is: ☐ 12 - 16 = H ☒ 6 - 11 = M ☐ 0 - 5 = L Record the rating on the first page**D 2.0. Does the landscape have the potential to support the water quality function of the site?****D 2.1. Does the wetland unit receive stormwater discharges?**

Yes = 1 No = 0

1

D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?

Yes = 1 No = 0

1

D 2.3. Are there septic systems within 250 ft of the wetland?

Yes = 1 No = 0

0

D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1 - D 2.3?Source Roadside debris/garbage

Yes = 1 No = 0

1

Total for D 2

Add the points in the boxes above

3**Rating of Landscape Potential** If score is: ☒ 3 or 4 = H ☐ 1 or 2 = M ☐ 0 = L Record the rating on the first page**D 3.0. Is the water quality improvement provided by the site valuable to society?****D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?**

Yes = 1 No = 0

0

D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list?

Yes = 1 No = 0

0

D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (answer YES if there is a TMDL for the basin in which the unit is found)?

Yes = 2 No = 0

2

Total for D 3

Add the points in the boxes above

2**Rating of Value** If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

DEPRESSIONAL AND FLATS WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream degradation**D 4.0. Does the site have the potential to reduce flooding and erosion?****D 4.1. Characteristics of surface water outflows from the wetland:**

- | | | |
|---|------------|---|
| Wetland is a depression or flat depression with no surface water leaving it (no outlet) | points = 4 | 2 |
| Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet | points = 2 | |
| Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch | points = 1 | |
| Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing | points = 0 | |

D 4.2. Depth of storage during wet periods: *Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.*

- | | | |
|---|------------|---|
| Marks of ponding are 3 ft or more above the surface or bottom of outlet | points = 7 | 3 |
| Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet | points = 5 | |
| <input type="checkbox"/> Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet | points = 3 | |
| <input type="checkbox"/> The wetland is a "headwater" wetland | points = 3 | |
| Wetland is flat but has small depressions on the surface that trap water | points = 1 | |
| Marks of ponding less than 0.5 ft (6 in) | points = 0 | |

D 4.3. Contribution of the wetland to storage in the watershed: *Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.*

- | | | |
|---|------------|---|
| <input type="checkbox"/> The area of the basin is less than 10 times the area of the unit | points = 5 | 3 |
| The area of the basin is 10 to 100 times the area of the unit | points = 3 | |
| The area of the basin is more than 100 times the area of the unit | points = 0 | |
| <input type="checkbox"/> Entire wetland is in the Flats class | points = 5 | |

Total for D 4 Add the points in the boxes above **8****Rating of Site Potential** If score is: ☐ 12 - 16 = H ☒ 6 - 11 = M ☐ 0 - 5 = L Record the rating on the first page**D 5.0. Does the landscape have the potential to support hydrologic function of the site?****D 5.1. Does the wetland unit receive stormwater discharges?** Yes = 1 No = 0 **1****D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff?** Yes = 1 No = 0 **1****D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)?** Yes = 1 No = 0 **0****Total for D 5** Add the points in the boxes above **2****Rating of Landscape Potential** If score is: ☐ 3 = H ☒ 1 or 2 = M ☐ 0 = L Record the rating on the first page**D 6.0. Are the hydrologic functions provided by the site valuable to society?****D 6.1. The unit is in a landscape that has flooding problems. Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.**

- | | |
|--|------------|
| The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds): | 2 |
| <input type="checkbox"/> • Flooding occurs in a sub-basin that is immediately down-gradient of unit. points = 2 | |
| <input type="checkbox"/> • Surface flooding problems are in a sub-basin farther down-gradient. points = 1 | |
| <input type="checkbox"/> Flooding from groundwater is an issue in the sub-basin. points = 1 | |
| <input type="checkbox"/> The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why | points = 0 |
| <input type="checkbox"/> There are no problems with flooding downstream of the wetland. | points = 0 |

D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0 **0****Total for D 6** Add the points in the boxes above **2****Rating of Value** If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L Record the rating on the first page

These questions apply to wetlands of all HGM classes.**HABITAT FUNCTIONS** - Indicators that site functions to provide important habitat**H 1.0. Does the site have the potential to provide habitat?**

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|---|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 1 |
| <input checked="" type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input checked="" type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

**None = 0 points****Low = 1 point****Moderate = 2 points**

1

All three diagrams
in this row are
HIGH = 3 points

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i>		2
<input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long)		
<input type="checkbox"/> Standing snags (dbh > 4 in) within the wetland		
<input type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m)		
<input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>)		
<input type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>)		
<input checked="" type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)		
Total for H 1		6

Rating of Site Potential If Score is: ☐ 15 - 18 = H ☐ 7 - 14 = M ☒ 0 - 6 = L Record the rating on the first page

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i> 27 % undisturbed habitat + (22 % moderate & low intensity land uses / 2) = 38%		
If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	3	
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i> 69 % undisturbed habitat + (27 % moderate & low intensity land uses / 2) = 82.5%		
Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	3	
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0		
Total for H 2		6

Rating of Landscape Potential If Score is: ☒ 4 - 6 = H ☐ 1 - 3 = M ☐ < 1 = L Record the rating on the first page

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.		
Site meets ANY of the following criteria: points = 2 <input checked="" type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan	2	
Site has 1 or 2 priority habitats (listed on next page) within 100m points = 1 Site does not meet any of the criteria above points = 0		

Rating of Value If Score is: ☒ 2 = H ☐ 1 = M ☐ 0 = L Record the rating on the first page

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☒ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☒ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☒ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

- ☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.
- ☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☒ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

- ☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks
- ☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☒ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

- ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).
- ☐ At least $\frac{3}{4}$ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
- ☐ The wetland is larger than $\frac{1}{10}$ ac (4350 ft²)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

- ☐ Long Beach Peninsula: Lands west of SR 103
- ☐ Grayland-Westport: Lands west of SR 105
- ☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☒ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ **NO** - go to 2

☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)**

☐ **YES - Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*

*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☒ **NO** - go to 3

☐ **YES** - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ **NO** - go to 4

☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☐ The wetland is on a slope (*slope can be very gradual*),

☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☐ The water leaves the wetland **without being impounded**.

☒ **NO** - go to 5

☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,

☐ The overbank flooding occurs at least once every 2 years.

☒ **NO** - go to 6

☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7

☒ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8

☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

DEPRESSIONAL AND FLATS WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality**D 1.0. Does the site have the potential to improve water quality?****D 1.1. Characteristics of surface water outflows from the wetland:**

Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet).	points = 3	3
Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet.	points = 2	
<input type="checkbox"/> Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing	points = 1	
<input type="checkbox"/> Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch.	points = 1	

D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions).

Yes = 4 No = 0

4

D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes):

Wetland has persistent, ungrazed, plants > 95% of area	points = 5	5
Wetland has persistent, ungrazed, plants > 1/2 of area	points = 3	
Wetland has persistent, ungrazed plants > 1/10 of area	points = 1	
Wetland has persistent, ungrazed plants < 1/10 of area	points = 0	

D 1.4. Characteristics of seasonal ponding or inundation:

<i>This is the area that is ponded for at least 2 months. See description in manual.</i>		4
Area seasonally ponded is > 1/2 total area of wetland	points = 4	
Area seasonally ponded is > 1/4 total area of wetland	points = 2	
Area seasonally ponded is < 1/4 total area of wetland	points = 0	

Total for D 1

Add the points in the boxes above

16**Rating of Site Potential** If score is: ☒ 12 - 16 = H ☐ 6 - 11 = M ☐ 0 - 5 = L Record the rating on the first page**D 2.0. Does the landscape have the potential to support the water quality function of the site?**

D 2.1. Does the wetland unit receive stormwater discharges?	Yes = 1 No = 0	1
D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	1
D 2.3. Are there septic systems within 250 ft of the wetland?	Yes = 1 No = 0	0
D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1 - D 2.3?		1
Source <u>Roadside debris/garbage</u>	Yes = 1 No = 0	

Total for D 2

Add the points in the boxes above

3**Rating of Landscape Potential** If score is: ☒ 3 or 4 = H ☐ 1 or 2 = M ☐ 0 = L Record the rating on the first page**D 3.0. Is the water quality improvement provided by the site valuable to society?**

D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?	Yes = 1 No = 0	0
D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list?	Yes = 1 No = 0	0
D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (answer YES if there is a TMDL for the basin in which the unit is found)?	Yes = 2 No = 0	2

Total for D 3

Add the points in the boxes above

2**Rating of Value** If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L Record the rating on the first page

DEPRESSIONAL AND FLATS WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream degradation**D 4.0. Does the site have the potential to reduce flooding and erosion?****D 4.1. Characteristics of surface water outflows from the wetland:**

- | | | |
|---|------------|---|
| Wetland is a depression or flat depression with no surface water leaving it (no outlet) | points = 4 | 4 |
| Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet | points = 2 | |
| Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch | points = 1 | |
| Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing | points = 0 | |

D 4.2. Depth of storage during wet periods: *Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.*

- | | | |
|---|------------|---|
| Marks of ponding are 3 ft or more above the surface or bottom of outlet | points = 7 | 3 |
| Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet | points = 5 | |
| <input type="checkbox"/> Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet | points = 3 | |
| <input type="checkbox"/> The wetland is a "headwater" wetland | points = 3 | |
| Wetland is flat but has small depressions on the surface that trap water | points = 1 | |
| Marks of ponding less than 0.5 ft (6 in) | points = 0 | |

D 4.3. Contribution of the wetland to storage in the watershed: *Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.*

- | | | |
|---|------------|---|
| <input type="checkbox"/> The area of the basin is less than 10 times the area of the unit | points = 5 | 5 |
| The area of the basin is 10 to 100 times the area of the unit | points = 3 | |
| The area of the basin is more than 100 times the area of the unit | points = 0 | |
| <input type="checkbox"/> Entire wetland is in the Flats class | points = 5 | |

Total for D 4 Add the points in the boxes above **12****Rating of Site Potential** If score is: ☒ **12 - 16 = H** ☐ **6 - 11 = M** ☐ **0 - 5 = L** Record the rating on the first page**D 5.0. Does the landscape have the potential to support hydrologic function of the site?****D 5.1. Does the wetland unit receive stormwater discharges?** Yes = 1 No = 0 **1****D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff?** Yes = 1 No = 0 **1****D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)?** Yes = 1 No = 0 **0****Total for D 5** Add the points in the boxes above **2****Rating of Landscape Potential** If score is: ☐ **3 = H** ☒ **1 or 2 = M** ☐ **0 = L** Record the rating on the first page**D 6.0. Are the hydrologic functions provided by the site valuable to society?****D 6.1. The unit is in a landscape that has flooding problems. Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.**

- | | | |
|--|------------|---|
| The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds): | | 2 |
| • Flooding occurs in a sub-basin that is immediately down-gradient of unit. | points = 2 | |
| <input type="checkbox"/> • Surface flooding problems are in a sub-basin farther down-gradient. | points = 1 | |
| <input type="checkbox"/> Flooding from groundwater is an issue in the sub-basin. | points = 1 | |
| <input type="checkbox"/> The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why | points = 0 | |
| <input type="checkbox"/> There are no problems with flooding downstream of the wetland. | points = 0 | |

D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0 **0****Total for D 6** Add the points in the boxes above **2****Rating of Value** If score is: ☒ **2 - 4 = H** ☐ **1 = M** ☐ **0 = L** Record the rating on the first page

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|--|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 2 |
| <input type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input checked="" type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input checked="" type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input checked="" type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = 0 points

Low = 1 point

Moderate = 2 points

2

All three diagrams
in this row are
HIGH = 3 points

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i>		3
<input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) <input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland <input type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) <input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>) <input type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>) <input checked="" type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)		
Total for H 1 Add the points in the boxes above		
Rating of Site Potential If Score is: <input type="checkbox"/> 15 - 18 = H <input checked="" type="checkbox"/> 7 - 14 = M <input type="checkbox"/> 0 - 6 = L Record the rating on the first page		
Rating of Site Potential If Score is: <input type="checkbox"/> 15 - 18 = H <input checked="" type="checkbox"/> 7 - 14 = M <input type="checkbox"/> 0 - 6 = L Record the rating on the first page		

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i> 25 % undisturbed habitat + (23 % moderate & low intensity land uses / 2) = 36.5%		
If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	3	
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i> 65 % undisturbed habitat + (29 % moderate & low intensity land uses / 2) = 79.5%		
Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	3	
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0		
Total for H 2 Add the points in the boxes above		6
Rating of Landscape Potential If Score is: <input checked="" type="checkbox"/> 4 - 6 = H <input type="checkbox"/> 1 - 3 = M <input type="checkbox"/> < 1 = L Record the rating on the first page		

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.		
Site meets ANY of the following criteria: points = 2 <input checked="" type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	2	
Rating of Value If Score is: <input checked="" type="checkbox"/> 2 = H <input type="checkbox"/> 1 = M <input type="checkbox"/> 0 = L		2
Record the rating on the first page		

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☒ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☒ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☒ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☒ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <div style="text-align: right;"> <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland </div>	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <div style="text-align: right;"> <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2 </div>	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <div style="text-align: right;"> <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II </div>	
SC 2.0. Wetlands of High Conservation Value (WHCV)	
SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <div style="text-align: right;"> <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 </div>	
SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <div style="text-align: right;"> <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV </div>	
SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <div style="text-align: right;"> <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV </div>	
SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <div style="text-align: right;"> <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV </div>	
SC 3.0. Bogs	
Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i>	
SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <div style="text-align: right;"> <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 </div>	
SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <div style="text-align: right;"> <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog </div>	
SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <div style="text-align: right;"> <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 </div>	
NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.	
SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <div style="text-align: right;"> <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog </div>	

<p>SC 4.0. Forested Wetlands</p> <p>Does the wetland have at least <u>1 contiguous acre</u> of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? <i>If you answer YES you will still need to rate the wetland based on its functions.</i></p> <p><input type="checkbox"/> Old-growth forests (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.</p> <p><input type="checkbox"/> Mature forests (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).</p> <p><input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not a forested wetland for this section</p>	
<p>SC 5.0. Wetlands in Coastal Lagoons</p> <p>Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?</p> <p><input type="checkbox"/> The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks</p> <p><input type="checkbox"/> The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (<i>needs to be measured near the bottom</i>)</p> <p><input type="checkbox"/> Yes - Go to SC 5.1 <input checked="" type="checkbox"/> No = Not a wetland in a coastal lagoon</p> <p>SC 5.1. Does the wetland meet all of the following three conditions?</p> <p><input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).</p> <p><input type="checkbox"/> At least $\frac{3}{4}$ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.</p> <p><input type="checkbox"/> The wetland is larger than $\frac{1}{10}$ ac (4350 ft²)</p> <p><input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II</p>	
<p>SC 6.0. Interdunal Wetlands</p> <p>Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? <i>If you answer yes you will still need to rate the wetland based on its habitat functions.</i></p> <p>In practical terms that means the following geographic areas:</p> <p><input type="checkbox"/> Long Beach Peninsula: Lands west of SR 103</p> <p><input type="checkbox"/> Grayland-Westport: Lands west of SR 105</p> <p><input type="checkbox"/> Ocean Shores-Copalis: Lands west of SR 115 and SR 109</p> <p><input type="checkbox"/> Yes - Go to SC 6.1 <input checked="" type="checkbox"/> No = Not an interdunal wetland for rating</p> <p>SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?</p> <p><input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 6.2</p> <p>SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?</p> <p><input type="checkbox"/> Yes = Category II <input type="checkbox"/> No - Go to SC 6.3</p> <p>SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?</p> <p><input type="checkbox"/> Yes = Category III <input type="checkbox"/> No = Category IV</p>	
<p>Category of wetland based on Special Characteristics</p> <p>If you answered No for all types, enter "Not Applicable" on Summary Form</p>

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ NO - go to 2

☐ YES - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ NO - **Saltwater Tidal Fringe (Estuarine)**

☐ YES - **Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.
If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☒ NO - go to 3

☐ YES - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ NO - go to 4

☐ YES - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☒ The wetland is on a slope (*slope can be very gradual*),

☒ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps.
It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☒ The water leaves the wetland **without being impounded**.

☐ NO - go to 5

☒ YES - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☒ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding
from that stream or river,

☒ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6

☒ YES - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7

☒ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8

☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

3 CLASSES PRESENT: portion of wetland is slope, portion of wetland is riverine, and portion of wetland is depressional.

DEPRESSIONAL AND FLATS WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality**D 1.0. Does the site have the potential to improve water quality?****D 1.1. Characteristics of surface water outflows from the wetland:**

Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet).

points = 3

Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet.

points = 2

☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing

points = 1

☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch.

points = 1

2

D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions).

Yes = 4 No = 0

0

D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes):

Wetland has persistent, ungrazed, plants > 95% of area

points = 5

Wetland has persistent, ungrazed, plants > 1/2 of area

points = 3

Wetland has persistent, ungrazed plants > 1/10 of area

points = 1

Wetland has persistent, ungrazed plants < 1/10 of area

points = 0

5

D 1.4. Characteristics of seasonal ponding or inundation:*This is the area that is ponded for at least 2 months. See description in manual.*

Area seasonally ponded is > 1/2 total area of wetland

points = 4

Area seasonally ponded is > 1/4 total area of wetland

points = 2

Area seasonally ponded is < 1/4 total area of wetland

points = 0

0

DEPRESSIONAL AND FLATS WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream degradation

D 4.0. Does the site have the potential to reduce flooding and erosion?		
D 4.1. Characteristics of surface water outflows from the wetland:		
Wetland is a depression or flat depression with no surface water leaving it (no outlet)	points = 4	2
Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet	points = 2	
Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch	points = 1	
Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing	points = 0	
D 4.2. Depth of storage during wet periods: <i>Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.</i>		
Marks of ponding are 3 ft or more above the surface or bottom of outlet	points = 7	0
Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet	points = 5	
<input type="checkbox"/> Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet	points = 3	
<input type="checkbox"/> The wetland is a "headwater" wetland	points = 3	
Wetland is flat but has small depressions on the surface that trap water	points = 1	
Marks of ponding less than 0.5 ft (6 in)	points = 0	
D 4.3. Contribution of the wetland to storage in the watershed: <i>Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.</i>		
<input type="checkbox"/> The area of the basin is less than 10 times the area of the unit	points = 5	3
The area of the basin is 10 to 100 times the area of the unit	points = 3	
The area of the basin is more than 100 times the area of the unit	points = 0	
<input type="checkbox"/> Entire wetland is in the Flats class	points = 5	
Total for D 4		5

Add the points in the boxes above

Rating of Site Potential If score is: ☐ 12 - 16 = H ☐ 6 - 11 = M ☒ 0 - 5 = L Record the rating on the first page

D 5.0. Does the landscape have the potential to support hydrologic function of the site?		
D 5.1. Does the wetland unit receive stormwater discharges?	Yes = 1 No = 0	1
D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff?	Yes = 1 No = 0	1
D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)?	Yes = 1 No = 0	0
Total for D 5		2

Add the points in the boxes above

Rating of Landscape Potential If score is: ☐ 3 = H ☒ 1 or 2 = M ☐ 0 = L Record the rating on the first page

D 6.0. Are the hydrologic functions provided by the site valuable to society?		
D 6.1. The unit is in a landscape that has flooding problems. Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.		
The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds):		2
<ul style="list-style-type: none"> • Flooding occurs in a sub-basin that is immediately down-gradient of unit. 	points = 2	
<input checked="" type="checkbox"/> <ul style="list-style-type: none"> • Surface flooding problems are in a sub-basin farther down-gradient. 	points = 1	
<input type="checkbox"/> Flooding from groundwater is an issue in the sub-basin.	points = 1	
<input type="checkbox"/> The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why	points = 0	
<input type="checkbox"/> There are no problems with flooding downstream of the wetland.	points = 0	
D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?		
	Yes = 2 No = 0	0
Total for D 6		2

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|--|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 1 |
| <input type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input checked="" type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input checked="" type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|---|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 3 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input checked="" type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input checked="" type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 2 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = 0 points

Low = 1 point

Moderate = 2 points

2

All three diagrams
in this row are
HIGH = 3 points

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i>		6
<input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long)		
<input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland		
<input checked="" type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m)		
<input checked="" type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>)		
<input checked="" type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>)		
<input checked="" type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)		
Total for H 1		14

Rating of Site Potential If Score is: ☐ 15 - 18 = H ☒ 7 - 14 = M ☐ 0 - 6 = L Record the rating on the first page

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). Calculate: 18 % undisturbed habitat + (17 % moderate & low intensity land uses / 2) = 26.5%		
If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	2	
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. Calculate: 55 % undisturbed habitat + (31 % moderate & low intensity land uses / 2) = 70.5%		
Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	3	
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0		
Total for H 2		5

Rating of Landscape Potential If Score is: ☒ 4 - 6 = H ☐ 1 - 3 = M ☐ < 1 = L Record the rating on the first page

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.		
Site meets ANY of the following criteria: points = 2 <input checked="" type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan	2	
Site has 1 or 2 priority habitats (listed on next page) within 100m points = 1 Site does not meet any of the criteria above points = 0		

Rating of Value If Score is: ☒ 2 = H ☐ 1 = M ☐ 0 = L Record the rating on the first page

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☒ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☒ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☒ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☒ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

SC 4.0. Forested Wetlands Does the wetland have at least <u>1 contiguous acre</u> of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? <i>If you answer YES you will still need to rate the wetland based on its functions.</i> <input type="checkbox"/> Old-growth forests (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more. <input checked="" type="checkbox"/> Mature forests (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm). <input checked="" type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not a forested wetland for this section	Cat. I	
SC 5.0. Wetlands in Coastal Lagoons Does the wetland meet all of the following criteria of a wetland in a coastal lagoon? <input type="checkbox"/> The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks <input type="checkbox"/> The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (<i>needs to be measured near the bottom</i>) <input type="checkbox"/> Yes - Go to SC 5.1 <input checked="" type="checkbox"/> No = Not a wetland in a coastal lagoon SC 5.1. Does the wetland meet all of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100). <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland is larger than 1/10 ac (4350 ft ²) <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II		
SC 6.0. Interdunal Wetlands Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? <i>If you answer yes you will still need to rate the wetland based on its habitat functions.</i> In practical terms that means the following geographic areas: <input type="checkbox"/> Long Beach Peninsula: Lands west of SR 103 <input type="checkbox"/> Grayland-Westport: Lands west of SR 105 <input type="checkbox"/> Ocean Shores-Copalis: Lands west of SR 115 and SR 109 <input type="checkbox"/> Yes - Go to SC 6.1 <input checked="" type="checkbox"/> No = Not an interdunal wetland for rating SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 6.2 SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger? <input type="checkbox"/> Yes = Category II <input type="checkbox"/> No - Go to SC 6.3 SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac? <input type="checkbox"/> Yes = Category III <input type="checkbox"/> No = Category IV		
Category of wetland based on Special Characteristics If you answered No for all types, enter "Not Applicable" on Summary Form	Cat. I	

Portions of the wetland boundary, that extend beyond the project, were estimated to complete the wetland rating. Refer to the JARPA figures for the surveyed wetland boundary.

Maps and Figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	
Hydroperiods	D 1.4, H 1.2	
Location of outlet (<i>can be added to map of hydroperiods</i>)	D 1.1, D 4.1	
Boundary of area within 150 ft of the wetland (<i>can be added to another figure</i>)	D 2.2, D 5.2	
Map of the contributing basin	D 4.3, D 5.3	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	D 3.3	

Riverine Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Ponded depressions	R 1.1	
Boundary of area within 150 ft of the wetland (<i>can be added to another figure</i>)	R 2.4	
Plant cover of trees, shrubs, and herbaceous plants	R 1.2, R 4.2	
Width of unit vs. width of stream (<i>can be added to another figure</i>)	R 4.1	
Map of the contributing basin	R 2.2, R 2.3, R 5.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	R 3.1	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	R 3.2, R 3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	L 1.1, L 4.1, H 1.1, H 1.4	
Plant cover of trees, shrubs, and herbaceous plants	L 1.2	
Boundary of area within 150 ft of the wetland (<i>can be added to another figure</i>)	L 2.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	L 3.1, L 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	L 3.3	

Slope Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Plant cover of dense trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of dense, rigid trees, shrubs, and herbaceous plants (<i>can be added to another figure</i>)	S 4.1	
Boundary of area within 150 ft of the wetland (<i>can be added to another figure</i>)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

- ☒ **NO** - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

- ☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*
*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

- ☒ **NO** - go to 3 ☐ **YES** - The wetland class is **Flats**
*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

- ☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

- ☒ **NO** - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

- ☒ The wetland is on a slope (*slope can be very gradual*),
☒ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☒ The water leaves the wetland **without being impounded**.

- ☐ **NO** - go to 5 ☒ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

- ☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

- ☒ **NO** - go to 6 ☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☒ NO - go to 7

☐ YES - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☒ NO - go to 8

☐ YES - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

SLOPE WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality

S 1.0. Does the site have the potential to improve water quality?

S 1.1. Characteristics of the average slope of the wetland: (*a 1% slope has a 1 ft vertical drop in elevation for every 100 ft of horizontal distance*)

Slope is 1% or less	points = 3	1
Slope is > 1% - 2%	points = 2	
Slope is > 2% - 5%	points = 1	
Slope is greater than 5%	points = 0	

S 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions):

Yes = 3 No = 0

0

S 1.3. Characteristics of the plants in the wetland that trap sediments and pollutants:

Choose the points appropriate for the description that best fits the plants in the wetland. *Dense means you have trouble seeing the soil surface (>75% cover), and uncut means not grazed or mowed and plants are higher than 6 in.*

Dense, uncut, herbaceous plants > 90% of the wetland area	points = 6	6
Dense, uncut, herbaceous plants > ½ of area	points = 3	
Dense, woody, plants > ½ of area	points = 2	
Dense, uncut, herbaceous plants > ¼ of area	points = 1	
Does not meet any of the criteria above for plants	points = 0	

Total for S 1

Add the points in the boxes above

7

Rating of Site Potential If score is: ☐ 12 = H ☒ 6 - 11 = M ☐ 0 - 5 = L

Record the rating on the first page

S 2.0. Does the landscape have the potential to support the water quality function of the site?

S 2.1. Is > 10% of the area within 150 ft on the uphill side of the wetland in land uses that generate pollutants?

Yes = 1 No = 0

1

S 2.2. Are there other sources of pollutants coming into the wetland that are not listed in question S 2.1?

Other Sources

Yes = 1 No = 0

0

Total for S 2

Add the points in the boxes above

1

Rating of Landscape Potential If score is: ☒ 1 - 2 = M ☐ 0 = L

Record the rating on the first page

S 3.0. Is the water quality improvement provided by the site valuable to society?

S 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?

Yes = 1 No = 0

0

S 3.2. Is the wetland in a basin or sub-basin where water quality is an issue? *At least one aquatic resource in the basin is on the 303(d) list.*

Yes = 1 No = 0

0

S 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? *Answer YES if there is a TMDL for the basin in which the unit is found?*

Yes = 2 No = 0

2

Total for S 3

Add the points in the boxes above

2

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

SLOPE WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream erosion

S 4.0. Does the site have the potential to reduce flooding and stream erosion?

S 4.1. Characteristics of plants that reduce the velocity of surface flows during storms: Choose the points appropriate for the description that best fits conditions in the wetland. <i>Stems of plants should be thick enough (usually > 1/8 in), or dense enough, to remain erect during surface flows.</i>	1
Dense, uncut, rigid plants cover > 90% of the area of the wetland	points = 1
All other conditions	points = 0

Rating of Site Potential If score is: ☒ 1 = M ☐ 0 = L

Record the rating on the first page

S 5.0. Does the landscape have the potential to support hydrologic functions of the site?

S 5.1. Is more than 25% of the area within 150 ft upslope of wetland in land uses or cover that generate excess surface runoff?	Yes = 1 No = 0	1
---	----------------	---

Rating of Landscape Potential If score is: ☒ 1 = M ☐ 0 = L

Record the rating on the first page

S 6.0. Are the hydrologic functions provided by the site valuable to society?

S 6.1. Distance to the nearest areas downstream that have flooding problems:		
The sub-basin immediately down-gradient of site has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	2
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	

S 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
--	----------------	---

Total for S 6	Add the points in the boxes above	2
---------------	-----------------------------------	---

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

NOTES and FIELD OBSERVATIONS:

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|---|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 1 |
| <input checked="" type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input checked="" type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = 0 points

Low = 1 point

Moderate = 2 points

1

All three diagrams
in this row are
HIGH = 3 points

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i>		2
<input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) <input type="checkbox"/> Standing snags (dbh > 4 in) within the wetland <input checked="" type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) <input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>) <input type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>) <input type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)		
Total for H 1		
Add the points in the boxes above		
6		

Rating of Site Potential If Score is: ☐ 15 - 18 = H ☐ 7 - 14 = M ☒ 0 - 6 = L Record the rating on the first page

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i> 20 % undisturbed habitat + (<u>12</u> % moderate & low intensity land uses / 2) = 26%		
If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0		2
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i> 54 % undisturbed habitat + (<u>28</u> % moderate & low intensity land uses / 2) = 68%		
Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0		2
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0		0
Total for H 2		
Add the points in the boxes above		4

Rating of Landscape Potential If Score is: ☒ 4 - 6 = H ☐ 1 - 3 = M ☐ < 1 = L Record the rating on the first page

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.		
Site meets ANY of the following criteria: points = 2 <input checked="" type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan		2
Site has 1 or 2 priority habitats (listed on next page) within 100m points = 1 Site does not meet any of the criteria above points = 0		

Rating of Value If Score is: ☒ 2 = H ☐ 1 = M ☐ 0 = L Record the rating on the first page

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☒ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☒ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☒ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☒ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

<p>SC 4.0. Forested Wetlands</p> <p>Does the wetland have at least <u>1 contiguous acre</u> of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? <i>If you answer YES you will still need to rate the wetland based on its functions.</i></p> <p><input type="checkbox"/> Old-growth forests (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.</p> <p><input type="checkbox"/> Mature forests (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).</p> <p><input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not a forested wetland for this section</p>	
<p>SC 5.0. Wetlands in Coastal Lagoons</p> <p>Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?</p> <p><input type="checkbox"/> The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks</p> <p><input type="checkbox"/> The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (<i>needs to be measured near the bottom</i>)</p> <p><input type="checkbox"/> Yes - Go to SC 5.1 <input checked="" type="checkbox"/> No = Not a wetland in a coastal lagoon</p> <p>SC 5.1. Does the wetland meet all of the following three conditions?</p> <p><input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).</p> <p><input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.</p> <p><input type="checkbox"/> The wetland is larger than 1/10 ac (4350 ft²)</p> <p><input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II</p>	
<p>SC 6.0. Interdunal Wetlands</p> <p>Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? <i>If you answer yes you will still need to rate the wetland based on its habitat functions.</i></p> <p>In practical terms that means the following geographic areas:</p> <p><input type="checkbox"/> Long Beach Peninsula: Lands west of SR 103</p> <p><input type="checkbox"/> Grayland-Westport: Lands west of SR 105</p> <p><input type="checkbox"/> Ocean Shores-Copalis: Lands west of SR 115 and SR 109</p> <p><input type="checkbox"/> Yes - Go to SC 6.1 <input checked="" type="checkbox"/> No = Not an interdunal wetland for rating</p> <p>SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?</p> <p><input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 6.2</p> <p>SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?</p> <p><input type="checkbox"/> Yes = Category II <input type="checkbox"/> No - Go to SC 6.3</p> <p>SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?</p> <p><input type="checkbox"/> Yes = Category III <input type="checkbox"/> No = Category IV</p>	
<p>Category of wetland based on Special Characteristics</p> <p>If you answered No for all types, enter "Not Applicable" on Summary Form</p>

Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ **NO** - go to 2

☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)**

☐ **YES - Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*

*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☒ **NO** - go to 3

☐ **YES** - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ **NO** - go to 4

☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☐ The wetland is on a slope (*slope can be very gradual*),

☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☐ The water leaves the wetland **without being impounded**.

☒ **NO** - go to 5

☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,

☐ The overbank flooding occurs at least once every 2 years.

☒ **NO** - go to 6

☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7

☒ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8

☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

DEPRESSIONAL AND FLATS WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality**D 1.0. Does the site have the potential to improve water quality?****D 1.1. Characteristics of surface water outflows from the wetland:**

Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet).

points = 3

Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet.

points = 2

☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing

points = 1

☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch.

points = 1

2

D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions).

Yes = 4 No = 0

0

D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes):

Wetland has persistent, ungrazed, plants > 95% of area

points = 5

Wetland has persistent, ungrazed, plants > 1/2 of area

points = 3

Wetland has persistent, ungrazed plants > 1/10 of area

points = 1

Wetland has persistent, ungrazed plants < 1/10 of area

points = 0

3

D 1.4. Characteristics of seasonal ponding or inundation:*This is the area that is ponded for at least 2 months. See description in manual.*

Area seasonally ponded is > 1/2 total area of wetland

points = 4

Area seasonally ponded is > 1/4 total area of wetland

points = 2

Area seasonally ponded is < 1/4 total area of wetland

points = 0

0

Total for D 1

Add the points in the boxes above

5

Rating of Site Potential If score is: ☐ 12 - 16 = H ☐ 6 - 11 = M ☒ 0 - 5 = L Record the rating on the first page**D 2.0. Does the landscape have the potential to support the water quality function of the site?****D 2.1. Does the wetland unit receive stormwater discharges?**

Yes = 1 No = 0

1

D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?

Yes = 1 No = 0

0

D 2.3. Are there septic systems within 250 ft of the wetland?

Yes = 1 No = 0

0

D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1 - D 2.3?

Source

Yes = 1 No = 0

0

Total for D 2

Add the points in the boxes above

1

Rating of Landscape Potential If score is: ☐ 3 or 4 = H ☒ 1 or 2 = M ☐ 0 = L Record the rating on the first page**D 3.0. Is the water quality improvement provided by the site valuable to society?****D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?**

Yes = 1 No = 0

0

D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list?

Yes = 1 No = 0

0

D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (answer YES if there is a TMDL for the basin in which the unit is found)?

Yes = 2 No = 0

2

Total for D 3

Add the points in the boxes above

2

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

DEPRESSIONAL AND FLATS WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream degradation**D 4.0. Does the site have the potential to reduce flooding and erosion?****D 4.1. Characteristics of surface water outflows from the wetland:**

- | | | |
|---|------------|---|
| Wetland is a depression or flat depression with no surface water leaving it (no outlet) | points = 4 | 2 |
| Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet | points = 2 | |
| Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch | points = 1 | |
| Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing | points = 0 | |

D 4.2. Depth of storage during wet periods: *Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.*

- | | | |
|--|------------|---|
| Marks of ponding are 3 ft or more above the surface or bottom of outlet | points = 7 | 3 |
| Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet | points = 5 | |
| <input checked="" type="checkbox"/> Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet | points = 3 | |
| <input type="checkbox"/> The wetland is a "headwater" wetland | points = 3 | |
| Wetland is flat but has small depressions on the surface that trap water | points = 1 | |
| Marks of ponding less than 0.5 ft (6 in) | points = 0 | |

D 4.3. Contribution of the wetland to storage in the watershed: *Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.*

- | | | |
|---|------------|---|
| <input type="checkbox"/> The area of the basin is less than 10 times the area of the unit | points = 5 | 3 |
| The area of the basin is 10 to 100 times the area of the unit | points = 3 | |
| The area of the basin is more than 100 times the area of the unit | points = 0 | |
| <input type="checkbox"/> Entire wetland is in the Flats class | points = 5 | |

Total for D 4 Add the points in the boxes above **8****Rating of Site Potential** If score is: ☐ 12 - 16 = H ☒ 6 - 11 = M ☐ 0 - 5 = L Record the rating on the first page**D 5.0. Does the landscape have the potential to support hydrologic function of the site?****D 5.1. Does the wetland unit receive stormwater discharges?** Yes = 1 No = 0 **1****D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff?** Yes = 1 No = 0 **0****D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)?** Yes = 1 No = 0 **0****Total for D 5** Add the points in the boxes above **1****Rating of Landscape Potential** If score is: ☐ 3 = H ☒ 1 or 2 = M ☐ 0 = L Record the rating on the first page**D 6.0. Are the hydrologic functions provided by the site valuable to society?****D 6.1. The unit is in a landscape that has flooding problems. Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.**

- | | | |
|--|------------|---|
| The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds): | | 2 |
| <ul style="list-style-type: none"> • Flooding occurs in a sub-basin that is immediately down-gradient of unit. | points = 2 | |
| <input type="checkbox"/> <ul style="list-style-type: none"> • Surface flooding problems are in a sub-basin farther down-gradient. | points = 1 | |
| <input type="checkbox"/> Flooding from groundwater is an issue in the sub-basin. | points = 1 | |
| <input type="checkbox"/> The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why | points = 0 | |
| <input type="checkbox"/> There are no problems with flooding downstream of the wetland. | points = 0 | |

D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0 **0****Total for D 6** Add the points in the boxes above **2****Rating of Value** If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L Record the rating on the first page

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|--|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 2 |
| <input type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input checked="" type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input checked="" type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input checked="" type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input checked="" type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = 0 points

Low = 1 point

Moderate = 2 points

1

All three diagrams
in this row are
HIGH = 3 points

<p>H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i></p> <p><input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long)</p> <p><input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland</p> <p><input type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m)</p> <p><input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>)</p> <p><input type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>)</p> <p><input type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)</p>	2
<p>Total for H 1 Add the points in the boxes above</p>	7

Rating of Site Potential If Score is: ☐ 15 - 18 = H ☒ 7 - 14 = M ☐ 0 - 6 = L Record the rating on the first page

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
<p>H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i></p> <p>33 % undisturbed habitat + (<u>5</u> % moderate & low intensity land uses / 2) = 35.5%</p> <p>If total accessible habitat is:</p> <p>> 1/3 (33.3%) of 1 km Polygon points = 3</p> <p>20 - 33% of 1 km Polygon points = 2</p> <p>10 - 19% of 1 km Polygon points = 1</p> <p>< 10 % of 1 km Polygon points = 0</p>	3
<p>H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i></p> <p>57 % undisturbed habitat + (<u>20</u> % moderate & low intensity land uses / 2) = 67%</p> <p>Undisturbed habitat > 50% of Polygon points = 3</p> <p>Undisturbed habitat 10 - 50% and in 1-3 patches points = 2</p> <p>Undisturbed habitat 10 - 50% and > 3 patches points = 1</p> <p>Undisturbed habitat < 10% of 1 km Polygon points = 0</p>	3
<p>H 2.3 Land use intensity in 1 km Polygon: If</p> <p>> 50% of 1 km Polygon is high intensity land use points = (-2)</p> <p>≤ 50% of 1km Polygon is high intensity points = 0</p>	0
<p>Total for H 2 Add the points in the boxes above</p>	6

Rating of Landscape Potential If Score is: ☒ 4 - 6 = H ☐ 1 - 3 = M ☐ < 1 = L Record the rating on the first page

H 3.0. Is the habitat provided by the site valuable to society?	
<p>H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.</p> <p>Site meets ANY of the following criteria: points = 2</p> <p><input type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page)</p> <p><input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists)</p> <p><input type="checkbox"/> It is mapped as a location for an individual WDFW priority species</p> <p><input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources</p> <p><input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan</p> <p>Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1</p> <p>Site does not meet any of the criteria above points = 0</p>	1

Rating of Value If Score is: ☐ 2 = H ☒ 1 = M ☐ 0 = L Record the rating on the first page

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☐ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☐ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

- ☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.
- ☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☒ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

- ☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks
- ☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☒ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

- ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).
- ☐ At least $\frac{3}{4}$ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
- ☐ The wetland is larger than $\frac{1}{10}$ ac (4350 ft²)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

- ☐ Long Beach Peninsula: Lands west of SR 103
- ☐ Grayland-Westport: Lands west of SR 105
- ☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☒ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ **NO** - go to 2

☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)**

☐ **YES - Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.
If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☒ **NO** - go to 3

☐ **YES** - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ **NO** - go to 4

☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☒ The wetland is on a slope (*slope can be very gradual*),

☒ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps.
It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☒ The water leaves the wetland **without being impounded**.

☐ **NO** - go to 5

☒ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,

☐ The overbank flooding occurs at least once every 2 years.

☐ **NO** - go to 6

☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7

☐ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8

☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. **GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT** (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

SLOPE WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality

S 1.0. Does the site have the potential to improve water quality?

S 1.1. Characteristics of the average slope of the wetland: (*a 1% slope has a 1 ft vertical drop in elevation for every 100 ft of horizontal distance*)

Slope is 1% or less	points = 3	0
Slope is > 1% - 2%	points = 2	
Slope is > 2% - 5%	points = 1	
Slope is greater than 5%	points = 0	

S 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions):

Yes = 3 No = 0

0

S 1.3. Characteristics of the plants in the wetland that trap sediments and pollutants:

Choose the points appropriate for the description that best fits the plants in the wetland. *Dense means you have trouble seeing the soil surface (>75% cover), and uncut means not grazed or mowed and plants are higher than 6 in.*

Dense, uncut, herbaceous plants > 90% of the wetland area	points = 6	6
Dense, uncut, herbaceous plants > ½ of area	points = 3	
Dense, woody, plants > ½ of area	points = 2	
Dense, uncut, herbaceous plants > ¼ of area	points = 1	
Does not meet any of the criteria above for plants	points = 0

Rating of Value If score is: ☐ 2 - 4 = H ☐ 1 = M ☒ 0 = L

Record the rating on the first page

NOTES and FIELD OBSERVATIONS:

These questions apply to wetlands of all HGM classes.**HABITAT FUNCTIONS** - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|---|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 0 |
| <input checked="" type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (see text for descriptions of hydroperiods).

- | | | |
|--|-------------------------------------|---|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 0 |
| <input type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | 2 points | |
| <input type="checkbox"/> Freshwater tidal wetland | 2 points | |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 0 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

**None** = 0 points**Low** = 1 point**Moderate** = 2 points

0

All three diagrams in this row are **HIGH** = 3 points

H 1.5. Special habitat features:

Check the habitat features that are present in the wetland. *The number of checks is the number of points.*

- ☐ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long)
- ☐ Standing snags (dbh > 4 in) within the wetland
- ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m)
- ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*)
- ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*)
- ☒ Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)

1

Total for H 1

Add the points in the boxes above

1

Rating of Site Potential If Score is: ☐ 15 - 18 = H ☐ 7 - 14 = M ☒ 0 - 6 = L Record the rating on the first page

H 2.0. Does the landscape have the potential to support the habitat function of the site?

H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*).

Calculate:

$$0 \% \text{ undisturbed habitat} + (0 \% \text{ moderate \& low intensity land uses} / 2) = 0\%$$

If total accessible habitat is:

> 1/3 (33.3%) of 1 km Polygon

points = 3

20 - 33% of 1 km Polygon

points = 2

10 - 19% of 1 km Polygon

points = 1

< 10 % of 1 km Polygon

points = 0

0

H 2.2. Undisturbed habitat in 1 km Polygon around the wetland.

Calculate:

$$38 \% \text{ undisturbed habitat} + (28 \% \text{ moderate \& low intensity land uses} / 2) = 52\%$$

Undisturbed habitat > 50% of Polygon

points = 3

Undisturbed habitat 10 - 50% and in 1-3 patches

points = 2

Undisturbed habitat 10 - 50% and > 3 patches

points = 1

Undisturbed habitat < 10% of 1 km Polygon

points = 0

3

H 2.3 Land use intensity in 1 km Polygon: If

> 50% of 1 km Polygon is high intensity land use

points = (-2)

≤ 50% of 1km Polygon is high intensity

points = 0

0

Total for H 2

Add the points in the boxes above

3

Rating of Landscape Potential If Score is: ☐ 4 - 6 = H ☒ 1 - 3 = M ☐ < 1 = L Record the rating on the first page

H 3.0. Is the habitat provided by the site valuable to society?

H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated.*

Site meets ANY of the following criteria:

points = 2

☐ It has 3 or more priority habitats within 100 m (see next page)

☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists)

☐ It is mapped as a location for an individual WDFW priority species

☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources

☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan

Site has 1 or 2 priority habitats (listed on next page) within 100m

points = 1

Site does not meet any of the criteria above

points = 0

1

Rating of Value If Score is: ☐ 2 = H ☒ 1 = M ☐ 0 = L

Record the rating on the first page

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☒ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☒ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☐ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input checked="" type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <div style="text-align: right;"> <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland </div>	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <div style="text-align: right;"> <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No - Go to SC 1.2 </div>	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or ungrazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <div style="text-align: right;"> <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II </div>	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <div style="text-align: right;"> <input checked="" type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 </div> SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <div style="text-align: right;"> <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV </div> SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <div style="text-align: right;"> <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV </div> SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <div style="text-align: right;"> <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV </div>	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <div style="text-align: right;"> <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No - Go to SC 3.2 </div> SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <div style="text-align: right;"> <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog </div> SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <div style="text-align: right;"> <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 </div> NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <div style="text-align: right;"> <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog </div>	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

- ☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.
- ☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☒ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

- ☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks
- ☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☒ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

- ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).
- ☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or ungrazed or un-mowed grassland.
- ☐ The wetland is larger than 1/10 ac (4350 ft²)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

- ☐ Long Beach Peninsula: Lands west of SR 103
- ☐ Grayland-Westport: Lands west of SR 105
- ☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☒ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Hydroperiods	H 1.2	
Plant cover of dense trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of dense, rigid trees, shrubs, and herbaceous plants (<i>can be added to another figure</i>)	S 4.1	
Boundary of area within 150 ft of the wetland (<i>can be added to another figure</i>)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ NO - go to 2

☐ YES - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ NO - **Saltwater Tidal Fringe (Estuarine)**

☐ YES - **Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*

*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☒ NO - go to 3

☐ YES - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ NO - go to 4

☐ YES - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☐ The wetland is on a slope (*slope can be very gradual*),

☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☐ The water leaves the wetland **without being impounded**.

☒ NO - go to 5

☐ YES - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,

☐ The overbank flooding occurs at least once every 2 years.

☒ NO - go to 6

☐ YES - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7

☒ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☒ NO - go to 8

☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

DEPRESSIONAL AND FLATS WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality**D 1.0. Does the site have the potential to improve water quality?****D 1.1. Characteristics of surface water outflows from the wetland:**

Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet).

points = 3

Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet.

points = 2

☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing

points = 1

☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch.

points = 1

2

D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions).

Yes = 4 No = 0

0

D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes):

Wetland has persistent, ungrazed, plants > 95% of area

points = 5

Wetland has persistent, ungrazed, plants > 1/2 of area

points = 3

Wetland has persistent, ungrazed plants > 1/10 of area

points = 1

Wetland has persistent, ungrazed plants < 1/10 of area

points = 0

5

D 1.4. Characteristics of seasonal ponding or inundation:*This is the area that is ponded for at least 2 months. See description in manual.*

Area seasonally ponded is > 1/2 total area of wetland

points = 4

Area seasonally ponded is > 1/4 total area of wetland

points = 2

Area seasonally ponded is < 1/4 total area of wetland

points = 0

4

Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff?** Yes = 1 No = 0 **0****D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)?** Yes = 1 No = 0 **1****Total for D 5** Add the points in the boxes above **1****Rating of Landscape Potential** If score is: ☐ 3 = H ☒ 1 or 2 = M ☐ 0 = L Record the rating on the first page**D 6.0. Are the hydrologic functions provided by the site valuable to society?****D 6.1. The unit is in a landscape that has flooding problems. Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.**

- | | | |
|--|------------|---|
| The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds): | | 2 |
| • Flooding occurs in a sub-basin that is immediately down-gradient of unit. | points = 2 | |
| <input type="checkbox"/> • Surface flooding problems are in a sub-basin farther down-gradient. | points = 1 | |
| <input type="checkbox"/> Flooding from groundwater is an issue in the sub-basin. | points = 1 | |
| <input type="checkbox"/> The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why | points = 0 | |
| <input type="checkbox"/> There are no problems with flooding downstream of the wetland. | points = 0 | |

D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0 **0****Total for D 6** Add the points in the boxes above **2****Rating of Value** If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L Record the rating on the first page

These questions apply to wetlands of all HGM classes.**HABITAT FUNCTIONS** - Indicators that site functions to provide important habitat**H 1.0.** Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|--|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 2 |
| <input type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input checked="" type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input checked="" type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input checked="" type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

**None** = 0 points**Low** = 1 point**Moderate** = 2 points

3

All three diagrams
in this row are
HIGH = 3 points

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i>		3
<input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) <input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland <input type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) <input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>) <input type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>) <input checked="" type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)		
Total for H 1 Add the points in the boxes above		
10		
Rating of Site Potential If Score is: <input type="checkbox"/> 15 - 18 = H <input checked="" type="checkbox"/> 7 - 14 = M <input type="checkbox"/> 0 - 6 = L Record the rating on the first page		

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i> 0 % undisturbed habitat + (_____ 9 % moderate & low intensity land uses / 2) = 4.5%		
If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0		0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i> 32 % undisturbed habitat + (_____ 29 % moderate & low intensity land uses / 2) = 46.5%		
Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0		1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0		
Total for H 2 Add the points in the boxes above		1
Rating of Landscape Potential If Score is: <input type="checkbox"/> 4 - 6 = H <input checked="" type="checkbox"/> 1 - 3 = M <input type="checkbox"/> < 1 = L Record the rating on the first page		

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated. Site meets ANY of the following criteria: points = 2 <input type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0		
Rating of Value If Score is: <input type="checkbox"/> 2 = H <input checked="" type="checkbox"/> 1 = M <input type="checkbox"/> 0 = L		1
Record the rating on the first page		

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☐ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☐ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

<p>SC 4.0. Forested Wetlands</p> <p>Does the wetland have at least <u>1 contiguous acre</u> of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? <i>If you answer YES you will still need to rate the wetland based on its functions.</i></p> <p><input type="checkbox"/> Old-growth forests (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.</p> <p><input type="checkbox"/> Mature forests (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).</p> <p><input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not a forested wetland for this section</p>	
<p>SC 5.0. Wetlands in Coastal Lagoons</p> <p>Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?</p> <p><input type="checkbox"/> The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks</p> <p><input type="checkbox"/> The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (<i>needs to be measured near the bottom</i>)</p> <p><input type="checkbox"/> Yes - Go to SC 5.1 <input checked="" type="checkbox"/> No = Not a wetland in a coastal lagoon</p> <p>SC 5.1. Does the wetland meet all of the following three conditions?</p> <p><input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).</p> <p><input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.</p> <p><input type="checkbox"/> The wetland is larger than 1/10 ac (4350 ft²)</p> <p><input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II</p>	
<p>SC 6.0. Interdunal Wetlands</p> <p>Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? <i>If you answer yes you will still need to rate the wetland based on its habitat functions.</i></p> <p>In practical terms that means the following geographic areas:</p> <p><input type="checkbox"/> Long Beach Peninsula: Lands west of SR 103</p> <p><input type="checkbox"/> Grayland-Westport: Lands west of SR 105</p> <p><input type="checkbox"/> Ocean Shores-Copalis: Lands west of SR 115 and SR 109</p> <p><input type="checkbox"/> Yes - Go to SC 6.1 <input checked="" type="checkbox"/> No = Not an interdunal wetland for rating</p> <p>SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?</p> <p><input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 6.2</p> <p>SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?</p> <p><input type="checkbox"/> Yes = Category II <input type="checkbox"/> No - Go to SC 6.3</p> <p>SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?</p> <p><input type="checkbox"/> Yes = Category III <input type="checkbox"/> No = Category IV</p>	
<p>Category of wetland based on Special Characteristics</p> <p>If you answered No for all types, enter "Not Applicable" on Summary Form</p>

Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ NO - go to 2

☐ YES - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ NO - **Saltwater Tidal Fringe (Estuarine)**

☐ YES - **Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*

*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☒ NO - go to 3

☐ YES - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ NO - go to 4

☐ YES - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☒ The wetland is on a slope (*slope can be very gradual*),

☒ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☒ The water leaves the wetland **without being impounded**.

☐ NO - go to 5

☒ YES - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,

☐ The overbank flooding occurs at least once every 2 years.

☒ NO - go to 6

☐ YES - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7

☒ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8

☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

DEPRESSIONAL AND FLATS WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality**D 1.0. Does the site have the potential to improve water quality?****D 1.1. Characteristics of surface water outflows from the wetland:**

Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet).

points = 3

Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet.

points = 2

☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing

points = 1

☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch.

points = 1

3

D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions).

Yes = 4 No = 0

0

D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes):

Wetland has persistent, ungrazed, plants > 95% of area

points = 5

Wetland has persistent, ungrazed, plants > 1/2 of area

points = 3

Wetland has persistent, ungrazed plants > 1/10 of area

points = 1

Wetland has persistent, ungrazed plants < 1/10 of area

points = 0

5

D 1.4. Characteristics of seasonal ponding or inundation:*This is the area that is ponded for at least 2 months. See description in manual.*

Area seasonally ponded is > 1/2 total area of wetland

points = 4

Area seasonally ponded is > 1/4 total area of wetland

points = 2

Area seasonally ponded is < 1/4 total area of wetland

points = 0

2

Total for D 1

Add the points in the boxes above

10**Rating of Site Potential** If score is: ☐ 12 - 16 = H ☒ 6 - 11 = M ☐ 0 - 5 = L Record the rating on the first page**D 2.0. Does the landscape have the potential to support the water quality function of the site?****D 2.1. Does the wetland unit receive stormwater discharges?**

Yes = 1 No = 0

0

D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?

Yes = 1 No = 0

1

D 2.3. Are there septic systems within 250 ft of the wetland?

Yes = 1 No = 0

0

D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1 - D 2.3?

Source

Yes = 1 No = 0

0

Total for D 2

Add the points in the boxes above

1**Rating of Landscape Potential** If score is: ☐ 3 or 4 = H ☒ 1 or 2 = M ☐ 0 = L Record the rating on the first page**D 3.0. Is the water quality improvement provided by the site valuable to society?****D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?**

Yes = 1 No = 0

0

D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list?

Yes = 1 No = 0

0

D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (answer YES if there is a TMDL for the basin in which the unit is found)?

Yes = 2 No = 0

2

Total for D 3

Add the points in the boxes above

2**Rating of Value** If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

DEPRESSIONAL AND FLATS WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream degradation**D 4.0. Does the site have the potential to reduce flooding and erosion?****D 4.1. Characteristics of surface water outflows from the wetland:**

- | | | |
|---|------------|---|
| Wetland is a depression or flat depression with no surface water leaving it (no outlet) | points = 4 | 4 |
| Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet | points = 2 | |
| Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch | points = 1 | |
| Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing | points = 0 | |

D 4.2. Depth of storage during wet periods: Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.

- | | | |
|---|------------|---|
| Marks of ponding are 3 ft or more above the surface or bottom of outlet | points = 7 | 5 |
| Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet | points = 5 | |
| <input type="checkbox"/> Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet | points = 3 | |
| <input type="checkbox"/> The wetland is a "headwater" wetland | points = 3 | |
| Wetland is flat but has small depressions on the surface that trap water | points = 1 | |
| Marks of ponding less than 0.5 ft (6 in) | points = 0 | |

D 4.3. Contribution of the wetland to storage in the watershed: Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.

- | | | |
|---|------------|---|
| <input type="checkbox"/> The area of the basin is less than 10 times the area of the unit | points = 5 | 3 |
| The area of the basin is 10 to 100 times the area of the unit | points = 3 | |
| The area of the basin is more than 100 times the area of the unit | points = 0 | |
| <input type="checkbox"/> Entire wetland is in the Flats class | points = 5 | |

Total for D 4 Add the points in the boxes above **12****Rating of Site Potential** If score is: ☒ 12 - 16 = H ☐ 6 - 11 = M ☐ 0 - 5 = L Record the rating on the first page**D 5.0. Does the landscape have the potential to support hydrologic function of the site?****D 5.1. Does the wetland unit receive stormwater discharges?** Yes = 1 No = 0 **0****D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff?** Yes = 1 No = 0 **1****D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)?** Yes = 1 No = 0 **1****Total for D 5** Add the points in the boxes above **2****Rating of Landscape Potential** If score is: ☐ 3 = H ☒ 1 or 2 = M ☐ 0 = L Record the rating on the first page**D 6.0. Are the hydrologic functions provided by the site valuable to society?****D 6.1. The unit is in a landscape that has flooding problems. Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.**

- | | | |
|--|------------|---|
| The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds): | | 2 |
| • Flooding occurs in a sub-basin that is immediately down-gradient of unit. | points = 2 | |
| <input type="checkbox"/> • Surface flooding problems are in a sub-basin farther down-gradient. | points = 1 | |
| <input type="checkbox"/> Flooding from groundwater is an issue in the sub-basin. | points = 1 | |
| <input type="checkbox"/> The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why | points = 0 | |
| <input type="checkbox"/> There are no problems with flooding downstream of the wetland. | points = 0 | |

D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0 **0****Total for D 6** Add the points in the boxes above **2****Rating of Value** If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L Record the rating on the first page

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|--|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 2 |
| <input type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input checked="" type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input checked="" type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input checked="" type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|---|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 2 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input checked="" type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = 0 points

Low = 1 point

Moderate = 2 points

2

All three diagrams
in this row are
HIGH = 3 points

<p>H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i></p> <p><input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long)</p> <p><input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland</p> <p><input type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m)</p> <p><input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>)</p> <p><input type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>)</p> <p><input checked="" type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)</p>	3
<p>Total for H 1 Add the points in the boxes above</p>	10

Rating of Site Potential If Score is: ☐ 15 - 18 = H ☒ 7 - 14 = M ☐ 0 - 6 = L Record the rating on the first page

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
<p>H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i></p> <p>0 % undisturbed habitat + (_____ 9 % moderate & low intensity land uses / 2) = 4.5%</p> <p>If total accessible habitat is:</p> <p>> 1/3 (33.3%) of 1 km Polygon points = 3</p> <p>20 - 33% of 1 km Polygon points = 2</p> <p>10 - 19% of 1 km Polygon points = 1</p> <p>< 10 % of 1 km Polygon points = 0</p>	0
<p>H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i></p> <p>29 % undisturbed habitat + (_____ 29 % moderate & low intensity land uses / 2) = 43.5%</p> <p>Undisturbed habitat > 50% of Polygon points = 3</p> <p>Undisturbed habitat 10 - 50% and in 1-3 patches points = 2</p> <p>Undisturbed habitat 10 - 50% and > 3 patches points = 1</p> <p>Undisturbed habitat < 10% of 1 km Polygon points = 0</p>	1
<p>H 2.3 Land use intensity in 1 km Polygon: If</p> <p>> 50% of 1 km Polygon is high intensity land use points = (-2)</p> <p>≤ 50% of 1km Polygon is high intensity points = 0</p>	0

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☒ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☒ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

<p>SC 4.0. Forested Wetlands</p> <p>Does the wetland have at least <u>1 contiguous acre</u> of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? <i>If you answer YES you will still need to rate the wetland based on its functions.</i></p> <p><input type="checkbox"/> Old-growth forests (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.</p> <p><input type="checkbox"/> Mature forests (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).</p> <p><input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not a forested wetland for this section</p>	
<p>SC 5.0. Wetlands in Coastal Lagoons</p> <p>Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?</p> <p><input type="checkbox"/> The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks</p> <p><input type="checkbox"/> The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (<i>needs to be measured near the bottom</i>)</p> <p><input type="checkbox"/> Yes - Go to SC 5.1 <input checked="" type="checkbox"/> No = Not a wetland in a coastal lagoon</p> <p>SC 5.1. Does the wetland meet all of the following three conditions?</p> <p><input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).</p> <p><input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.</p> <p><input type="checkbox"/> The wetland is larger than 1/10 ac (4350 ft²)</p> <p><input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II</p>	
<p>SC 6.0. Interdunal Wetlands</p> <p>Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? <i>If you answer yes you will still need to rate the wetland based on its habitat functions.</i></p> <p>In practical terms that means the following geographic areas:</p> <p><input type="checkbox"/> Long Beach Peninsula: Lands west of SR 103</p> <p><input type="checkbox"/> Grayland-Westport: Lands west of SR 105</p> <p><input type="checkbox"/> Ocean Shores-Copalis: Lands west of SR 115 and SR 109</p> <p><input type="checkbox"/> Yes - Go to SC 6.1 <input checked="" type="checkbox"/> No = Not an interdunal wetland for rating</p> <p>SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?</p> <p><input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 6.2</p> <p>SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?</p> <p><input type="checkbox"/> Yes = Category II <input type="checkbox"/> No - Go to SC 6.3</p> <p>SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?</p> <p><input type="checkbox"/> Yes = Category III <input type="checkbox"/> No = Category IV</p>	
<p>Category of wetland based on Special Characteristics</p> <p>If you answered No for all types, enter "Not Applicable" on Summary Form</p>

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ NO - go to 2

☐ YES - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ NO - **Saltwater Tidal Fringe (Estuarine)**

☐ YES - **Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*

*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☒ NO - go to 3

☐ YES - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ NO - go to 4

☐ YES - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☒ The wetland is on a slope (*slope can be very gradual*),

☒ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps.
It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☒ The water leaves the wetland **without being impounded**.

☐ NO - go to 5

☒ YES - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding
from that stream or river,

☐ The overbank flooding occurs at least once every 2 years.

☒ NO - go to 6

☐ YES - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☒ NO - go to 7

☐ YES - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☒ NO - go to 8

☐ YES - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

SLOPE WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality

S 1.0. Does the site have the potential to improve water quality?

S 1.1. Characteristics of the average slope of the wetland: (*a 1% slope has a 1 ft vertical drop in elevation for every 100 ft of horizontal distance*)

Slope is 1% or less	points = 3	1
Slope is > 1% - 2%	points = 2	
Slope is > 2% - 5%	points = 1	
Slope is greater than 5%	points = 0	

S 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions):

Yes = 3 No = 0

0

S 1.3. Characteristics of the plants in the wetland that trap sediments and pollutants:

Choose the points appropriate for the description that best fits the plants in the wetland. *Dense means you have trouble seeing the soil surface (>75% cover), and uncut means not grazed or mowed and plants are higher than 6 in.*

Dense, uncut, herbaceous plants > 90% of the wetland area	points = 6	2
Dense, uncut, herbaceous plants > ½ of area	points = 3	
Dense, woody, plants > ½ of area	points = 2	
Dense, uncut, herbaceous plants > ¼ of area	points = 1	
Does not meet any of the criteria above for plants	points = 0	

Total for S 1

Add the points in the boxes above

3

Rating of Site Potential If score is: ☐ 12 = H ☐ 6 - 11 = M ☒ 0 - 5 = L

Record the rating on the first page

S 2.0. Does the landscape have the potential to support the water quality function of the site?

S 2.1. Is > 10% of the area within 150 ft on the uphill side of the wetland in land uses that generate pollutants?

Yes = 1 No = 0

0

S 2.2. Are there other sources of pollutants coming into the wetland that are not listed in question S 2.1?

Other Sources Yes = 1 No = 0

0

Total for S 2

Add the points in the boxes above

0

Rating of Landscape Potential If score is: ☐ 1 - 2 = M ☒ 0 = L

Record the rating on the first page

S 3.0. Is the water quality improvement provided by the site valuable to society?

S 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?

Yes = 1 No = 0

0

S 3.2. Is the wetland in a basin or sub-basin where water quality is an issue? *At least one aquatic resource in the basin is on the 303(d) list.*

Yes = 1 No = 0

0

S 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? *Answer YES if there is a TMDL for the basin in which the unit is found?*

Yes = 2 No = 0

2

Total for S 3

Add the points in the boxes above

2

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

SLOPE WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream erosion

S 4.0. Does the site have the potential to reduce flooding and stream erosion?

S 4.1. Characteristics of plants that reduce the velocity of surface flows during storms: Choose the points appropriate for the description that best fits conditions in the wetland. <i>Stems of plants should be thick enough (usually > 1/8 in), or dense enough, to remain erect during surface flows.</i>	1
Dense, uncut, rigid plants cover > 90% of the area of the wetland	points = 1
All other conditions	points = 0

Rating of Site Potential If score is: ☒ 1 = M ☐ 0 = L

Record the rating on the first page

S 5.0. Does the landscape have the potential to support hydrologic functions of the site?

S 5.1. Is more than 25% of the area within 150 ft upslope of wetland in land uses or cover that generate excess surface runoff?	Yes = 1 No = 0	0
---	----------------	---

Rating of Landscape Potential If score is: ☐ 1 = M ☒ 0 = L

Record the rating on the first page

S 6.0. Are the hydrologic functions provided by the site valuable to society?

S 6.1. Distance to the nearest areas downstream that have flooding problems:		
The sub-basin immediately down-gradient of site has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	2
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	

S 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
--	----------------	---

Total for S 6	Add the points in the boxes above	2
---------------	-----------------------------------	---

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

NOTES and FIELD OBSERVATIONS:

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|---|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 0 |
| <input type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input checked="" type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = 0 points

Low = 1 point

Moderate = 2 points

0

All three diagrams
in this row are
HIGH = 3 points

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i>		2
<input type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) <input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland <input type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) <input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>) <input type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>) <input checked="" type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)		
Total for H 1		
Add the points in the boxes above		
4		

Rating of Site Potential If Score is: ☐ 15 - 18 = H ☐ 7 - 14 = M ☒ 0 - 6 = L Record the rating on the first page

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i> 0 % undisturbed habitat + (9 % moderate & low intensity land uses / 2) = 4.5%		
If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0		0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i> 26 % undisturbed habitat + (32 % moderate & low intensity land uses / 2) = 42%		
Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0		1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0		0
Total for H 2		
Add the points in the boxes above		1

Rating of Landscape Potential If Score is: ☐ 4 - 6 = H ☒ 1 - 3 = M ☐ < 1 = L Record the rating on the first page

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.		
Site meets ANY of the following criteria: points = 2 <input type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan		1
Site has 1 or 2 priority habitats (listed on next page) within 100m points = 1		
Site does not meet any of the criteria above points = 0		

Rating of Value If Score is: ☐ 2 = H ☒ 1 = M ☐ 0 = L Record the rating on the first page

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☐ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☐ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

- ☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.
- ☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☒ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

- ☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks
- ☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☒ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

- ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).
- ☐ At least $\frac{3}{4}$ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
- ☐ The wetland is larger than $\frac{1}{10}$ ac (4350 ft²)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

- ☐ Long Beach Peninsula: Lands west of SR 103
- ☐ Grayland-Westport: Lands west of SR 105
- ☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☒ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ NO - go to 2

☐ YES - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ NO - **Saltwater Tidal Fringe (Estuarine)**

☐ YES - **Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*

*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☒ NO - go to 3

☐ YES - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ NO - go to 4

☐ YES - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☒ The wetland is on a slope (*slope can be very gradual*),

☒ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps.
It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☒ The water leaves the wetland **without being impounded**.

☐ NO - go to 5

☒ YES - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding
from that stream or river,

☐ The overbank flooding occurs at least once every 2 years.

☒ NO - go to 6

☐ YES - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☒ NO - go to 7

☐ YES - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☒ NO - go to 8

☐ YES - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

SLOPE WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality

S 1.0. Does the site have the potential to improve water quality?

S 1.1. Characteristics of the average slope of the wetland: (*a 1% slope has a 1 ft vertical drop in elevation for every 100 ft of horizontal distance*)

Slope is 1% or less	points = 3	2
Slope is > 1% - 2%	points = 2	
Slope is > 2% - 5%	points = 1	
Slope is greater than 5%	points = 0	

S 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions):

Yes = 3 No = 0

0

S 1.3. Characteristics of the plants in the wetland that trap sediments and pollutants:

Choose the points appropriate for the description that best fits the plants in the wetland. *Dense means you have trouble seeing the soil surface (>75% cover), and uncut means not grazed or mowed and plants are higher than 6 in.*

Dense, uncut, herbaceous plants > 90% of the wetland area	points = 6	2
Dense, uncut, herbaceous plants > 1/2 of area	points = 3	
Dense, woody, plants > 1/2 of area	points = 2	
Dense, uncut, herbaceous plants > 1/4 of area	points = 1	
Does not meet any of the criteria above for plants	points = 0	

Total for S 1

Add the points in the boxes above

4

Rating of Site Potential If score is: ☐ 12 = H ☐ 6 - 11 = M ☒ 0 - 5 = L

Record the rating on the first page

S 2.0. Does the landscape have the potential to support the water quality function of the site?

S 2.1. Is > 10% of the area within 150 ft on the uphill side of the wetland in land uses that generate pollutants?

Yes = 1 No = 0

0

S 2.2. Are there other sources of pollutants coming into the wetland that are not listed in question S 2.1?

Other Sources Yes = 1 No = 0

0

Total for S 2

Add the points in the boxes above

0

Rating of Landscape Potential If score is: ☐ 1 - 2 = M ☒ 0 = L

Record the rating on the first page

S 3.0. Is the water quality improvement provided by the site valuable to society?

S 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?

Yes = 1 No = 0

0

S 3.2. Is the wetland in a basin or sub-basin where water quality is an issue? *At least one aquatic resource in the basin is on the 303(d) list.*

Yes = 1 No = 0

0

S 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? *Answer YES if there is a TMDL for the basin in which the unit is found?*

Yes = 2 No = 0

2

Total for S 3

Add the points in the boxes above

2

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

SLOPE WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream erosion

S 4.0. Does the site have the potential to reduce flooding and stream erosion?

S 4.1. Characteristics of plants that reduce the velocity of surface flows during storms: Choose the points appropriate for the description that best fits conditions in the wetland. <i>Stems of plants should be thick enough (usually > 1/8 in), or dense enough, to remain erect during surface flows.</i>	1
Dense, uncut, rigid plants cover > 90% of the area of the wetland	points = 1
All other conditions	points = 0

Rating of Site Potential If score is: ☒ 1 = M ☐ 0 = L

Record the rating on the first page

S 5.0. Does the landscape have the potential to support hydrologic functions of the site?

S 5.1. Is more than 25% of the area within 150 ft upslope of wetland in land uses or cover that generate excess surface runoff?	Yes = 1 No = 0	0
---	----------------	---

Rating of Landscape Potential If score is: ☐ 1 = M ☒ 0 = L

Record the rating on the first page

S 6.0. Are the hydrologic functions provided by the site valuable to society?

S 6.1. Distance to the nearest areas downstream that have flooding problems:		
The sub-basin immediately down-gradient of site has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	2
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	

S 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
--	----------------	---

Total for S 6	Add the points in the boxes above	2
---------------	-----------------------------------	---

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

NOTES and FIELD OBSERVATIONS:

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|---|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 1 |
| <input type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input checked="" type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input checked="" type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = 0 points

Low = 1 point

Moderate = 2 points

All three diagrams
in this row are
HIGH = 3 points

2

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i>		3
<input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) <input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland <input type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) <input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>) <input type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>) <input checked="" type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)		
Total for H 1		
Add the points in the boxes above		
8		

Rating of Site Potential If Score is: ☐ 15 - 18 = H ☒ 7 - 14 = M ☐ 0 - 6 = L Record the rating on the first page

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i> 0 % undisturbed habitat + (_____ 9 % moderate & low intensity land uses / 2) = 4.5%		
If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0		0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i> 23 % undisturbed habitat + (_____ 36 % moderate & low intensity land uses / 2) = 41%		
Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0		2
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0		0
Total for H 2		
Add the points in the boxes above		2

Rating of Landscape Potential If Score is: ☐ 4 - 6 = H ☒ 1 - 3 = M ☐ < 1 = L Record the rating on the first page

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.		
Site meets ANY of the following criteria: points = 2 <input type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan		1
Site has 1 or 2 priority habitats (listed on next page) within 100m points = 1		
Site does not meet any of the criteria above points = 0		

Rating of Value If Score is: ☐ 2 = H ☒ 1 = M ☐ 0 = L Record the rating on the first page

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☐ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☐ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

- ☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.
- ☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☒ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

- ☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks
- ☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☒ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

- ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).
- ☐ At least $\frac{3}{4}$ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
- ☐ The wetland is larger than $\frac{1}{10}$ ac (4350 ft²)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

- ☐ Long Beach Peninsula: Lands west of SR 103
- ☐ Grayland-Westport: Lands west of SR 105
- ☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☒ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

- ☒ **NO** - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

- ☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*
*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

- ☒ **NO** - go to 3 ☐ **YES** - The wetland class is **Flats**
*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

- ☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

- ☒ **NO** - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

- ☒ The wetland is on a slope (*slope can be very gradual*),
☒ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☒ The water leaves the wetland **without being impounded**.

- ☐ **NO** - go to 5 ☒ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

- ☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

- ☒ **NO** - go to 6 ☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☒ NO - go to 7

☐ YES - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☒ NO - go to 8

☐ YES - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

SLOPE WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality

S 1.0. Does the site have the potential to improve water quality?

S 1.1. Characteristics of the average slope of the wetland: (*a 1% slope has a 1 ft vertical drop in elevation for every 100 ft of horizontal distance*)

Slope is 1% or less	points = 3	1
Slope is > 1% - 2%	points = 2	
Slope is > 2% - 5%	points = 1	
Slope is greater than 5%	points = 0	

S 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions):

Yes = 3 No = 0

0

S 1.3. Characteristics of the plants in the wetland that trap sediments and pollutants:

Choose the points appropriate for the description that best fits the plants in the wetland. *Dense means you have trouble seeing the soil surface (>75% cover), and uncut means not grazed or mowed and plants are higher than 6 in.*

Dense, uncut, herbaceous plants > 90% of the wetland area	points = 6	2
Dense, uncut, herbaceous plants > 1/2 of area	points = 3	
Dense, woody, plants > 1/2 of area	points = 2	
Dense, uncut, herbaceous plants > 1/4 of area	points = 1	
Does not meet any of the criteria above for plants	points = 0	

Total for S 1

Add the points in the boxes above

3

Rating of Site Potential If score is: ☐ 12 = H ☐ 6 - 11 = M ☒ 0 - 5 = L

Record the rating on the first page

S 2.0. Does the landscape have the potential to support the water quality function of the site?

S 2.1. Is > 10% of the area within 150 ft on the uphill side of the wetland in land uses that generate pollutants?

Yes = 1 No = 0

0

S 2.2. Are there other sources of pollutants coming into the wetland that are not listed in question S 2.1?

Other Sources Yes = 1 No = 0

0

Total for S 2

Add the points in the boxes above

0

Rating of Landscape Potential If score is: ☐ 1 - 2 = M ☒ 0 = L

Record the rating on the first page

S 3.0. Is the water quality improvement provided by the site valuable to society?

S 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?

Yes = 1 No = 0

0

S 3.2. Is the wetland in a basin or sub-basin where water quality is an issue? *At least one aquatic resource in the basin is on the 303(d) list.*

Yes = 1 No = 0

0

S 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? *Answer YES if there is a TMDL for the basin in which the unit is found?*

Yes = 2 No = 0

2

Total for S 3

Add the points in the boxes above

2

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

SLOPE WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream erosion

S 4.0. Does the site have the potential to reduce flooding and stream erosion?

S 4.1. Characteristics of plants that reduce the velocity of surface flows during storms: Choose the points appropriate for the description that best fits conditions in the wetland. <i>Stems of plants should be thick enough (usually > 1/8 in), or dense enough, to remain erect during surface flows.</i>	1
Dense, uncut, rigid plants cover > 90% of the area of the wetland	points = 1
All other conditions	points = 0

Rating of Site Potential If score is: ☒ 1 = M ☐ 0 = L

Record the rating on the first page

S 5.0. Does the landscape have the potential to support hydrologic functions of the site?

S 5.1. Is more than 25% of the area within 150 ft upslope of wetland in land uses or cover that generate excess surface runoff?	Yes = 1 No = 0	0
---	----------------	---

Rating of Landscape Potential If score is: ☐ 1 = M ☒ 0 = L

Record the rating on the first page

S 6.0. Are the hydrologic functions provided by the site valuable to society?

S 6.1. Distance to the nearest areas downstream that have flooding problems:		
The sub-basin immediately down-gradient of site has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	2
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	

S 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
--	----------------	---

Total for S 6	Add the points in the boxes above	2
---------------	-----------------------------------	---

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

NOTES and FIELD OBSERVATIONS:

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|---|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 1 |
| <input type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input checked="" type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input checked="" type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = 0 points

Low = 1 point

Moderate = 2 points

1

All three diagrams
in this row are
HIGH = 3 points

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i>		2
<input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) <input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland <input type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) <input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>) <input type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>) <input type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)		
Total for H 1		
Add the points in the boxes above		
6		

Rating of Site Potential If Score is: ☐ 15 - 18 = H ☐ 7 - 14 = M ☒ 0 - 6 = L Record the rating on the first page

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i> 0 % undisturbed habitat + (_____ 9 % moderate & low intensity land uses / 2) = 4.5%		
If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0		0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i> 24 % undisturbed habitat + (_____ 38 % moderate & low intensity land uses / 2) = 43%		
Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0		2
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0		0
Total for H 2		2
Add the points in the boxes above		

Rating of Landscape Potential If Score is: ☐ 4 - 6 = H ☒ 1 - 3 = M ☐ < 1 = L Record the rating on the first page

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.		
Site meets ANY of the following criteria: points = 2 <input type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan		1
Site has 1 or 2 priority habitats (listed on next page) within 100m points = 1 Site does not meet any of the criteria above points = 0		

Rating of Value If Score is: ☐ 2 = H ☒ 1 = M ☐ 0 = L Record the rating on the first page

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☐ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☐ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

- ☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.
- ☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☒ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

- ☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks
- ☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☒ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

- ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).
- ☐ At least $\frac{3}{4}$ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
- ☐ The wetland is larger than $\frac{1}{10}$ ac (4350 ft²)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

- ☐ Long Beach Peninsula: Lands west of SR 103
- ☐ Grayland-Westport: Lands west of SR 105
- ☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☒ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ NO - go to 2

☐ YES - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ NO - **Saltwater Tidal Fringe (Estuarine)**

☐ YES - **Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*

*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☒ NO - go to 3

☐ YES - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ NO - go to 4

☐ YES - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☒ The wetland is on a slope (*slope can be very gradual*),

☒ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☒ The water leaves the wetland **without being impounded**.

☐ NO - go to 5

☒ YES - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,

☐ The overbank flooding occurs at least once every 2 years.

☒ NO - go to 6

☐ YES - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☒ NO - go to 7

☐ YES - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☒ NO - go to 8

☐ YES - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

SLOPE WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality

S 1.0. Does the site have the potential to improve water quality?

S 1.1. Characteristics of the average slope of the wetland: (*a 1% slope has a 1 ft vertical drop in elevation for every 100 ft of horizontal distance*)

Slope is 1% or less	points = 3	0
Slope is > 1% - 2%	points = 2	
Slope is > 2% - 5%	points = 1	
Slope is greater than 5%	points = 0	

S 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions):

Yes = 3 No = 0

0

S 1.3. Characteristics of the plants in the wetland that trap sediments and pollutants:

Choose the points appropriate for the description that best fits the plants in the wetland. *Dense means you have trouble seeing the soil surface (>75% cover), and uncut means not grazed or mowed and plants are higher than 6 in.*

Dense, uncut, herbaceous plants > 90% of the wetland area	points = 6	2
Dense, uncut, herbaceous plants > 1/2 of area	points = 3	
Dense, woody, plants > 1/2 of area	points = 2	
Dense, uncut, herbaceous plants > 1/4 of area	points = 1	
Does not meet any of the criteria above for plants	points = 0	

Total for S 1

Add the points in the boxes above

2

Rating of Site Potential If score is: ☐ 12 = H ☐ 6 - 11 = M ☒ 0 - 5 = L

Record the rating on the first page

S 2.0. Does the landscape have the potential to support the water quality function of the site?

S 2.1. Is > 10% of the area within 150 ft on the uphill side of the wetland in land uses that generate pollutants?

Yes = 1 No = 0

1

S 2.2. Are there other sources of pollutants coming into the wetland that are not listed in question S 2.1?

Other Sources Yes = 1 No = 0

1

Total for S 2

Add the points in the boxes above

2

Rating of Landscape Potential If score is: ☒ 1 - 2 = M ☐ 0 = L

Record the rating on the first page

S 3.0. Is the water quality improvement provided by the site valuable to society?

S 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?

Yes = 1 No = 0

0

S 3.2. Is the wetland in a basin or sub-basin where water quality is an issue? *At least one aquatic resource in the basin is on the 303(d) list.*

Yes = 1 No = 0

0

S 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? *Answer YES if there is a TMDL for the basin in which the unit is found?*

Yes = 2 No = 0

2

Total for S 3

Add the points in the boxes above

2

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

SLOPE WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream erosion

S 4.0. Does the site have the potential to reduce flooding and stream erosion?

S 4.1. Characteristics of plants that reduce the velocity of surface flows during storms: Choose the points appropriate for the description that best fits conditions in the wetland. <i>Stems of plants should be thick enough (usually $> 1/8$ in), or dense enough, to remain erect during surface flows.</i>	1
Dense, uncut, rigid plants cover $> 90\%$ of the area of the wetland	points = 1
All other conditions	points = 0

Rating of Site Potential If score is: ☒ 1 = M ☐ 0 = L

Record the rating on the first page

S 5.0. Does the landscape have the potential to support hydrologic functions of the site?

S 5.1. Is more than 25% of the area within 150 ft upslope of wetland in land uses or cover that generate excess surface runoff?	Yes = 1 No = 0	1
---	----------------	---

Rating of Landscape Potential If score is: ☒ 1 = M ☐ 0 = L

Record the rating on the first page

S 6.0. Are the hydrologic functions provided by the site valuable to society?

S 6.1. Distance to the nearest areas downstream that have flooding problems:		
The sub-basin immediately down-gradient of site has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	2
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	

S 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
--	----------------	---

Total for S 6	Add the points in the boxes above	2
---------------	-----------------------------------	---

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

NOTES and FIELD OBSERVATIONS:

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|---|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 1 |
| <input checked="" type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input checked="" type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = 0 points

Low = 1 point

Moderate = 2 points

1

All three diagrams
in this row are
HIGH = 3 points

H 1.5. Special habitat features:

Check the habitat features that are present in the wetland. *The number of checks is the number of points.*

- ☐ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long)
- ☐ Standing snags (dbh > 4 in) within the wetland
- ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m)
- ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*)
- ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*)
- ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)

0

Total for H 1

Add the points in the boxes above

Rating of Site Potential If Score is: ☐ 15 - 18 = H ☐ 7 - 14 = M ☒ 0 - 6 = L Record the rating on the first page

H 2.0. Does the landscape have the potential to support the habitat function of the site?

H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*).

Calculate:

0 % undisturbed habitat + (_____ 9 % moderate & low intensity land uses / 2) = 4.5%

If total accessible habitat is:

> 1/3 (33.3%) of 1 km Polygon

points = 3

20 - 33% of 1 km Polygon

points = 2

10 - 19% of 1 km Polygon

points = 1

< 10 % of 1 km Polygon

points = 0

0

H 2.2. Undisturbed habitat in 1 km Polygon around the wetland.

Calculate:

25 % undisturbed habitat + (_____ 38 % moderate & low intensity land uses / 2) = 44%

Undisturbed habitat > 50% of Polygon

points = 3

Undisturbed habitat 10 - 50% and in 1-3 patches

points = 2

Undisturbed habitat 10 - 50% and > 3 patches

points = 1

Undisturbed habitat < 10% of 1 km Polygon

points = 0

2

H 2.3 Land use intensity in 1 km Polygon: If

> 50% of 1 km Polygon is high intensity land use

points = (-2)

≤ 50% of 1km Polygon is high intensity

points = 0

0

Total for H 2

Add the points in the boxes above

2

Rating of Landscape Potential If Score is: ☐ 4 - 6 = H ☒ 1 - 3 = M ☐ < 1 = L Record the rating on the first page

H 3.0. Is the habitat provided by the site valuable to society?

H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.

Site meets ANY of the following criteria:

points = 2

☐ It has 3 or more priority habitats within 100 m (see next page)

☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists)

☐ It is mapped as a location for an individual WDFW priority species

☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources

☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan

Site has 1 or 2 priority habitats (listed on next page) within 100m

points = 1

Site does not meet any of the criteria above

points = 0

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☐ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☐ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

- ☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.
- ☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☒ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

- ☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks
- ☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☒ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

- ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).
- ☐ At least $\frac{3}{4}$ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
- ☐ The wetland is larger than $\frac{1}{10}$ ac (4350 ft²)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

- ☐ Long Beach Peninsula: Lands west of SR 103
- ☐ Grayland-Westport: Lands west of SR 105
- ☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☒ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ NO - go to 2

☐ YES - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ NO - **Saltwater Tidal Fringe (Estuarine)**

☐ YES - **Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*

*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☒ NO - go to 3

☐ YES - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ NO - go to 4

☐ YES - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☒ The wetland is on a slope (*slope can be very gradual*),

☒ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☒ The water leaves the wetland **without being impounded**.

☐ NO - go to 5

☒ YES - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,

☐ The overbank flooding occurs at least once every 2 years.

☒ NO - go to 6

☐ YES - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☒ NO - go to 7

☐ YES - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☒ NO - go to 8

☐ YES - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

SLOPE WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality

S 1.0. Does the site have the potential to improve water quality?

S 1.1. Characteristics of the average slope of the wetland: (*a 1% slope has a 1 ft vertical drop in elevation for every 100 ft of horizontal distance*)

Slope is 1% or less	points = 3	1
Slope is > 1% - 2%	points = 2	
Slope is > 2% - 5%	points = 1	
Slope is greater than 5%	points = 0	

S 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions):

Yes = 3 No = 0

0

S 1.3. Characteristics of the plants in the wetland that trap sediments and pollutants:

Choose the points appropriate for the description that best fits the plants in the wetland. *Dense means you have trouble seeing the soil surface (>75% cover), and uncut means not grazed or mowed and plants are higher than 6 in.*

Dense, uncut, herbaceous plants > 90% of the wetland area	points = 6	6
Dense, uncut, herbaceous plants > 1/2 of area	points = 3	
Dense, woody, plants > 1/2 of area	points = 2	
Dense, uncut, herbaceous plants > 1/4 of area	points = 1	
Does not meet any of the criteria above for plants	points = 0

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

SLOPE WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream erosion

S 4.0. Does the site have the potential to reduce flooding and stream erosion?

S 4.1. Characteristics of plants that reduce the velocity of surface flows during storms: Choose the points appropriate for the description that best fits conditions in the wetland. <i>Stems of plants should be thick enough (usually > 1/8 in), or dense enough, to remain erect during surface flows.</i>	1
Dense, uncut, rigid plants cover > 90% of the area of the wetland	points = 1
All other conditions	points = 0

Rating of Site Potential If score is: ☒ 1 = M ☐ 0 = L

Record the rating on the first page

S 5.0. Does the landscape have the potential to support hydrologic functions of the site?

S 5.1. Is more than 25% of the area within 150 ft upslope of wetland in land uses or cover that generate excess surface runoff?	Yes = 1 No = 0	1
---	----------------	---

Rating of Landscape Potential If score is: ☒ 1 = M ☐ 0 = L

Record the rating on the first page

S 6.0. Are the hydrologic functions provided by the site valuable to society?

S 6.1. Distance to the nearest areas downstream that have flooding problems:		
The sub-basin immediately down-gradient of site has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	2
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	

S 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
--	----------------	---

Total for S 6	Add the points in the boxes above	2
---------------	-----------------------------------	---

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

NOTES and FIELD OBSERVATIONS:

These questions apply to wetlands of all HGM classes.**HABITAT FUNCTIONS** - Indicators that site functions to provide important habitat**H 1.0. Does the site have the potential to provide habitat?**

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|---|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 1 |
| <input checked="" type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input checked="" type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

**None** = 0 points**Low** = 1 point**Moderate** = 2 points

All three diagrams
in this row are
HIGH = 3 points

1

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i>		2
<input type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) <input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland <input type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) <input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>) <input checked="" type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>) <input type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)		
Total for H 1		
Add the points in the boxes above		
6		

Rating of Site Potential If Score is: ☐ 15 - 18 = H ☐ 7 - 14 = M ☒ 0 - 6 = L Record the rating on the first page

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i> 0 % undisturbed habitat + (_____ 0 % moderate & low intensity land uses / 2) = 0%		
If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0		0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i> 28 % undisturbed habitat + (_____ 42 % moderate & low intensity land uses / 2) = 49%		
Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0		2
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0		0
Total for H 2		
Add the points in the boxes above		2

Rating of Landscape Potential If Score is: ☐ 4 - 6 = H ☒ 1 - 3 = M ☐ < 1 = L Record the rating on the first page

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.		
Site meets ANY of the following criteria: points = 2 <input type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan		1
Site has 1 or 2 priority habitats (listed on next page) within 100m points = 1		
Site does not meet any of the criteria above points = 0		

Rating of Value If Score is: ☐ 2 = H ☒ 1 = M ☐ 0 = L Record the rating on the first page

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☐ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☐ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

<p>SC 4.0. Forested Wetlands</p> <p>Does the wetland have at least <u>1 contiguous acre</u> of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? <i>If you answer YES you will still need to rate the wetland based on its functions.</i></p> <p><input type="checkbox"/> Old-growth forests (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.</p> <p><input type="checkbox"/> Mature forests (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).</p> <p><input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not a forested wetland for this section</p>	
<p>SC 5.0. Wetlands in Coastal Lagoons</p> <p>Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?</p> <p><input type="checkbox"/> The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks</p> <p><input type="checkbox"/> The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (<i>needs to be measured near the bottom</i>)</p> <p><input type="checkbox"/> Yes - Go to SC 5.1 <input checked="" type="checkbox"/> No = Not a wetland in a coastal lagoon</p> <p>SC 5.1. Does the wetland meet all of the following three conditions?</p> <p><input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).</p> <p><input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.</p> <p><input type="checkbox"/> The wetland is larger than 1/10 ac (4350 ft²)</p> <p><input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II</p>	
<p>SC 6.0. Interdunal Wetlands</p> <p>Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? <i>If you answer yes you will still need to rate the wetland based on its habitat functions.</i></p> <p>In practical terms that means the following geographic areas:</p> <p><input type="checkbox"/> Long Beach Peninsula: Lands west of SR 103</p> <p><input type="checkbox"/> Grayland-Westport: Lands west of SR 105</p> <p><input type="checkbox"/> Ocean Shores-Copalis: Lands west of SR 115 and SR 109</p> <p><input type="checkbox"/> Yes - Go to SC 6.1 <input checked="" type="checkbox"/> No = Not an interdunal wetland for rating</p> <p>SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?</p> <p><input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 6.2</p> <p>SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?</p> <p><input type="checkbox"/> Yes = Category II <input type="checkbox"/> No - Go to SC 6.3</p> <p>SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?</p> <p><input type="checkbox"/> Yes = Category III <input type="checkbox"/> No = Category IV</p>	
<p>Category of wetland based on Special Characteristics</p> <p>If you answered No for all types, enter "Not Applicable" on Summary Form</p>

Hydroperiods	H 1.2	
Plant cover of dense trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of dense, rigid trees, shrubs, and herbaceous plants (<i>can be added to another figure</i>)	S 4.1	
Boundary of area within 150 ft of the wetland (<i>can be added to another figure</i>)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

- ☒ **NO** - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

- ☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*
*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

- ☒ **NO** - go to 3 ☐ **YES** - The wetland class is **Flats**
*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

- ☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

- ☒ **NO** - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

- ☒ The wetland is on a slope (*slope can be very gradual*),
☒ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☒ The water leaves the wetland **without being impounded**.

- ☐ **NO** - go to 5 ☒ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

- ☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

- ☒ **NO** - go to 6 ☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☒ NO - go to 7

☐ YES - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☒ NO - go to 8

☐ YES - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

SLOPE WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality

S 1.0. Does the site have the potential to improve water quality?

S 1.1. Characteristics of the average slope of the wetland: (*a 1% slope has a 1 ft vertical drop in elevation for every 100 ft of horizontal distance*)

Slope is 1% or less	points = 3	1
Slope is > 1% - 2%	points = 2	
Slope is > 2% - 5%	points = 1	
Slope is greater than 5%	points = 0	

S 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions):

Yes = 3 No = 0

0

S 1.3. Characteristics of the plants in the wetland that trap sediments and pollutants:

Choose the points appropriate for the description that best fits the plants in the wetland. *Dense means you have trouble seeing the soil surface (>75% cover), and uncut means not grazed or mowed and plants are higher than 6 in.*

Dense, uncut, herbaceous plants > 90% of the wetland area	points = 6	2
Dense, uncut, herbaceous plants > 1/2 of area	points = 3	
Dense, woody, plants > 1/2 of area	points = 2	
Dense, uncut, herbaceous plants > 1/4 of area	points = 1	
Does not meet any of the criteria above for plants	points = 0	

Total for S 1

Add the points in the boxes above

3

Rating of Site Potential If score is: ☐ 12 = H ☐ 6 - 11 = M ☒ 0 - 5 = L

Record the rating on the first page

S 2.0. Does the landscape have the potential to support the water quality function of the site?

S 2.1. Is > 10% of the area within 150 ft on the uphill side of the wetland in land uses that generate pollutants?

Yes = 1 No = 0

1

S 2.2. Are there other sources of pollutants coming into the wetland that are not listed in question S 2.1?

Other Sources

Yes = 1 No = 0

0

Total for S 2

Add the points in the boxes above

1

Rating of Landscape Potential If score is: ☒ 1 - 2 = M ☐ 0 = L

Record the rating on the first page

S 3.0. Is the water quality improvement provided by the site valuable to society?

S 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?

Yes = 1 No = 0

0

S 3.2. Is the wetland in a basin or sub-basin where water quality is an issue? *At least one aquatic resource in the basin is on the 303(d) list.*

Yes = 1 No = 0

0

S 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? *Answer YES if there is a TMDL for the basin in which the unit is found?*

Yes = 2 No = 0

2

Total for S 3

Add the points in the boxes above

2

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

SLOPE WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream erosion

S 4.0. Does the site have the potential to reduce flooding and stream erosion?

S 4.1. Characteristics of plants that reduce the velocity of surface flows during storms: Choose the points appropriate for the description that best fits conditions in the wetland. *Stems of plants should be thick enough (usually $> 1/8$ in), or dense enough, to remain erect during surface flows.*Dense, uncut, **rigid** plants cover $> 90\%$ of the area of the wetland

points = 1

All other conditions

points = 0

1

Rating of Site Potential If score is: ☒ 1 = M ☐ 0 = L

Record the rating on the first page

S 5.0. Does the landscape have the potential to support hydrologic functions of the site?

S 5.1. Is more than 25% of the area within 150 ft upslope of wetland in land uses or cover that generate excess surface runoff?

Yes = 1 No = 0

1

Rating of Landscape Potential If score is: ☒ 1 = M ☐ 0 = L

Record the rating on the first page

S 6.0. Are the hydrologic functions provided by the site valuable to society?

S 6.1. Distance to the nearest areas downstream that have flooding problems:

The sub-basin immediately down-gradient of site has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)

points = 2

2

Surface flooding problems are in a sub-basin farther down-gradient

points = 1

No flooding problems anywhere downstream

points = 0

S 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?

Yes = 2 No = 0

0

Total for S 6

Add the points in the boxes above

2

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

NOTES and FIELD OBSERVATIONS:

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|--|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 1 |
| <input type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input checked="" type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input checked="" type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = 0 points

Low = 1 point

Moderate = 2 points

1

All three diagrams
in this row are
HIGH = 3 points

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i>		4
<input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) <input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland <input checked="" type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) <input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>) <input type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>) <input checked="" type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)		
Total for H 1		
Add the points in the boxes above		
8		

Rating of Site Potential If Score is: ☐ 15 - 18 = H ☒ 7 - 14 = M ☐ 0 - 6 = L Record the rating on the first page

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i> 0 % undisturbed habitat + (3 % moderate & low intensity land uses / 2) = 1.5%		
If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0		0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i> 27 % undisturbed habitat + (35 % moderate & low intensity land uses / 2) = 44.5%		
Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0		2
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0		0
Total for H 2		
Add the points in the boxes above		2

Rating of Landscape Potential If Score is: ☐ 4 - 6 = H ☒ 1 - 3 = M ☐ < 1 = L Record the rating on the first page

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.		
Site meets ANY of the following criteria: points = 2 <input type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan		1
Site has 1 or 2 priority habitats (listed on next page) within 100m points = 1		
Site does not meet any of the criteria above points = 0		

Rating of Value If Score is: ☐ 2 = H ☒ 1 = M ☐ 0 = L Record the rating on the first page

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☐ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☐ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

- ☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.
- ☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☒ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

- ☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks
- ☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☒ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

- ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).
- ☐ At least $\frac{3}{4}$ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
- ☐ The wetland is larger than $\frac{1}{10}$ ac (4350 ft²)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

- ☐ Long Beach Peninsula: Lands west of SR 103
- ☐ Grayland-Westport: Lands west of SR 105
- ☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☒ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ **NO** - go to 2

☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)**

☐ **YES - Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*

*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☒ **NO** - go to 3

☐ **YES** - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ **NO** - go to 4

☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☐ The wetland is on a slope (*slope can be very gradual*),

☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☐ The water leaves the wetland **without being impounded**.

☒ **NO** - go to 5

☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,

☐ The overbank flooding occurs at least once every 2 years.

☒ **NO** - go to 6

☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7

☒ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8

☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

DEPRESSIONAL AND FLATS WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality**D 1.0. Does the site have the potential to improve water quality?****D 1.1. Characteristics of surface water outflows from the wetland:**

Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet).

points = 3

Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet.

points = 2

☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing

points = 1

☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch.

points = 1

2

D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions).

Yes = 4 No = 0

0

D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes):

Wetland has persistent, ungrazed, plants > 95% of area

points = 5

Wetland has persistent, ungrazed, plants > 1/2 of area

points = 3

Wetland has persistent, ungrazed plants > 1/10 of area

points = 1

Wetland has persistent, ungrazed plants < 1/10 of area

points = 0

5

D 1.4. Characteristics of seasonal ponding or inundation:*This is the area that is ponded for at least 2 months. See description in manual.*

Area seasonally ponded is > 1/2 total area of wetland

points = 4

Area seasonally ponded is > 1/4 total area of wetland

points = 2

Area seasonally ponded is < 1/4 total area of wetland

points = 0

0

Total for D 1

Add the points in the boxes above

7

Rating of Site Potential If score is: ☐ 12 - 16 = H ☒ 6 - 11 = M ☐ 0 - 5 = L Record the rating on the first page**D 2.0. Does the landscape have the potential to support the water quality function of the site?****D 2.1. Does the wetland unit receive stormwater discharges?**

Yes = 1 No = 0

1

D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?

Yes = 1 No = 0

1

D 2.3. Are there septic systems within 250 ft of the wetland?

Yes = 1 No = 0

0

D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1 - D 2.3?

Source

Yes = 1 No = 0

0

Total for D 2

Add the points in the boxes above

2

Rating of Landscape Potential If score is: ☐ 3 or 4 = H ☒ 1 or 2 = M ☐ 0 = L Record the rating on the first page**D 3.0. Is the water quality improvement provided by the site valuable to society?****D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?**

Yes = 1 No = 0

0

D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list?

Yes = 1 No = 0

0

D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (answer YES if there is a TMDL for the basin in which the unit is found)?

Yes = 2 No = 0

2

Total for D 3

Add the points in the boxes above

2

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

DEPRESSIONAL AND FLATS WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream degradation**D 4.0. Does the site have the potential to reduce flooding and erosion?****D 4.1. Characteristics of surface water outflows from the wetland:**

- | | | |
|---|------------|---|
| Wetland is a depression or flat depression with no surface water leaving it (no outlet) | points = 4 | 2 |
| Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet | points = 2 | |
| Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch | points = 1 | |
| Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing | points = 0 | |

D 4.2. Depth of storage during wet periods: Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.

- | | | |
|--|------------|---|
| Marks of ponding are 3 ft or more above the surface or bottom of outlet | points = 7 | 3 |
| Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet | points = 5 | |
| <input checked="" type="checkbox"/> Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet | points = 3 | |
| <input type="checkbox"/> The wetland is a "headwater" wetland | points = 3 | |
| Wetland is flat but has small depressions on the surface that trap water | points = 1 | |
| Marks of ponding less than 0.5 ft (6 in) | points = 0 | |

D 4.3. Contribution of the wetland to storage in the watershed: Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.

- | | | |
|---|------------|---|
| <input type="checkbox"/> The area of the basin is less than 10 times the area of the unit | points = 5 | 3 |
| The area of the basin is 10 to 100 times the area of the unit | points = 3 | |
| The area of the basin is more than 100 times the area of the unit | points = 0 | |
| <input type="checkbox"/> Entire wetland is in the Flats class | points = 5 | |

Total for D 4 Add the points in the boxes above **8****Rating of Site Potential** If score is: ☐ 12 - 16 = H ☒ 6 - 11 = M ☐ 0 - 5 = L Record the rating on the first page**D 5.0. Does the landscape have the potential to support hydrologic function of the site?****D 5.1. Does the wetland unit receive stormwater discharges?** Yes = 1 No = 0 **1****D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff?** Yes = 1 No = 0 **1****D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)?** Yes = 1 No = 0 **0****Total for D 5** Add the points in the boxes above **2****Rating of Landscape Potential** If score is: ☐ 3 = H ☒ 1 or 2 = M ☐ 0 = L Record the rating on the first page**D 6.0. Are the hydrologic functions provided by the site valuable to society?****D 6.1. The unit is in a landscape that has flooding problems. Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.**

- | | | |
|--|------------|---|
| The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds): | | 2 |
| • Flooding occurs in a sub-basin that is immediately down-gradient of unit. | points = 2 | |
| <input type="checkbox"/> • Surface flooding problems are in a sub-basin farther down-gradient. | points = 1 | |
| <input type="checkbox"/> Flooding from groundwater is an issue in the sub-basin. | points = 1 | |
| <input type="checkbox"/> The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why | points = 0 | |
| <input type="checkbox"/> There are no problems with flooding downstream of the wetland. | points = 0 | |

D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0 **0****Total for D 6** Add the points in the boxes above **2****Rating of Value** If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L Record the rating on the first page

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|--|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 1 |
| <input type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input checked="" type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input checked="" type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|-----------------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = 0 points

Low = 1 point

Moderate = 2 points

1

All three diagrams
in this row are
HIGH = 3 points

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i>		4
<input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) <input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland <input checked="" type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) <input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>) <input type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>) <input checked="" type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)		
Total for H 1 Add the points in the boxes above		
Rating of Site Potential If Score is: <input type="checkbox"/> 15 - 18 = H <input checked="" type="checkbox"/> 7 - 14 = M <input type="checkbox"/> 0 - 6 = L Record the rating on the first page		

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i> 0 % undisturbed habitat + (<u>3</u> % moderate & low intensity land uses / 2) = 1.5%		
If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0		0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i> 34 % undisturbed habitat + (<u>32</u> % moderate & low intensity land uses / 2) = 50%		
Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0		2
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0		
Total for H 2 Add the points in the boxes above		2
Rating of Landscape Potential If Score is: <input type="checkbox"/> 4 - 6 = H <input checked="" type="checkbox"/> 1 - 3 = M <input type="checkbox"/> < 1 = L Record the rating on the first page		

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.		
Site meets ANY of the following criteria: points = 2 <input checked="" type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0		2
Rating of Value If Score is: <input checked="" type="checkbox"/> 2 = H <input type="checkbox"/> 1 = M <input type="checkbox"/> 0 = L Record the rating on the first page		

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☒ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☒ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

- ☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.
- ☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☒ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

- ☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks
- ☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☒ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

- ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).
- ☐ At least $\frac{3}{4}$ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
- ☐ The wetland is larger than $\frac{1}{10}$ ac (4350 ft²)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

- ☐ Long Beach Peninsula: Lands west of SR 103
- ☐ Grayland-Westport: Lands west of SR 105
- ☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☒ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ NO - go to 2

☐ YES - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ NO - **Saltwater Tidal Fringe (Estuarine)**

☐ YES - **Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*

*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☒ NO - go to 3

☐ YES - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ NO - go to 4

☐ YES - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☒ The wetland is on a slope (*slope can be very gradual*),

☒ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☒ The water leaves the wetland **without being impounded**.

☐ NO - go to 5

☒ YES - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,

☐ The overbank flooding occurs at least once every 2 years.

☒ NO - go to 6

☐ YES - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7

☒ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8

☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

SLOPE WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality

S 1.0. Does the site have the potential to improve water quality?

S 1.1. Characteristics of the average slope of the wetland: (*a 1% slope has a 1 ft vertical drop in elevation for every 100 ft of horizontal distance*)

Slope is 1% or less	points = 3	1
Slope is > 1% - 2%	points = 2	
Slope is > 2% - 5%	points = 1	
Slope is greater than 5%	points = 0	

S 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions):

Yes = 3 No = 0

0

S 1.3. Characteristics of the plants in the wetland that trap sediments and pollutants:

Choose the points appropriate for the description that best fits the plants in the wetland. *Dense means you have trouble seeing the soil surface (>75% cover), and uncut means not grazed or mowed and plants are higher than 6 in.*

Dense, uncut, herbaceous plants > 90% of the wetland area	points = 6	2
Dense, uncut, herbaceous plants > 1/2 of area	points = 3	
Dense, woody, plants > 1/2 of area	points = 2	
Dense, uncut, herbaceous plants > 1/4 of area	points = 1	
Does not meet any of the criteria above for plants	points = 0	

Total for S 1

Add the points in the boxes above

3

Rating of Site Potential If score is: ☐ 12 = H ☐ 6 - 11 = M ☒ 0 - 5 = L

Record the rating on the first page

S 2.0. Does the landscape have the potential to support the water quality function of the site?

S 2.1. Is > 10% of the area within 150 ft on the uphill side of the wetland in land uses that generate pollutants?

Yes = 1 No = 0

1

S 2.2. Are there other sources of pollutants coming into the wetland that are not listed in question S 2.1?

Other Sources Yes = 1 No = 0

0

Total for S 2

Add the points in the boxes above

1

Rating of Landscape Potential If score is: ☒ 1 - 2 = M ☐ 0 = L

Record the rating on the first page

S 3.0. Is the water quality improvement provided by the site valuable to society?

S 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?

Yes = 1 No = 0

0

S 3.2. Is the wetland in a basin or sub-basin where water quality is an issue? *At least one aquatic resource in the basin is on the 303(d) list.*

Yes = 1 No = 0

0

S 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? *Answer YES if there is a TMDL for the basin in which the unit is found?*

Yes = 2 No = 0

2

Total for S 3

Add the points in the boxes above

2

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

SLOPE WETLANDS**Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream erosion

S 4.0. Does the site have the potential to reduce flooding and stream erosion?

S 4.1. Characteristics of plants that reduce the velocity of surface flows during storms: Choose the points appropriate for the description that best fits conditions in the wetland. <i>Stems of plants should be thick enough (usually > 1/8 in), or dense enough, to remain erect during surface flows.</i>	0
Dense, uncut, rigid plants cover > 90% of the area of the wetland	points = 1
All other conditions	points = 0

Rating of Site Potential If score is: ☐ 1 = M ☒ 0 = L

Record the rating on the first page

S 5.0. Does the landscape have the potential to support hydrologic functions of the site?

S 5.1. Is more than 25% of the area within 150 ft upslope of wetland in land uses or cover that generate excess surface runoff?	Yes = 1 No = 0	1
---	----------------	---

Rating of Landscape Potential If score is: ☒ 1 = M ☐ 0 = L

Record the rating on the first page

S 6.0. Are the hydrologic functions provided by the site valuable to society?

S 6.1. Distance to the nearest areas downstream that have flooding problems:		
The sub-basin immediately down-gradient of site has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	2
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	

S 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
--	----------------	---

Total for S 6	Add the points in the boxes above	2
---------------	-----------------------------------	---

Rating of Value If score is: ☒ 2 - 4 = H ☐ 1 = M ☐ 0 = L

Record the rating on the first page

NOTES and FIELD OBSERVATIONS:

These questions apply to wetlands of all HGM classes.**HABITAT FUNCTIONS** - Indicators that site functions to provide important habitat**H 1.0.** Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- | | | |
|--|----------------------------------|---|
| <input type="checkbox"/> Aquatic bed | 4 structures or more: points = 4 | 2 |
| <input type="checkbox"/> Emergent | 3 structures: points = 2 | |
| <input checked="" type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) | 2 structures: points = 1 | |
| <input checked="" type="checkbox"/> Forested (areas where trees have > 30% cover) | 1 structure: points = 0 | |
| <i>If the unit has a Forested class, check if:</i> | | |
| <input checked="" type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon | | |

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- | | | |
|--|-------------------------------------|----------|
| <input type="checkbox"/> Permanently flooded or inundated | 4 or more types present: points = 3 | 1 |
| <input checked="" type="checkbox"/> Seasonally flooded or inundated | 3 types present: points = 2 | |
| <input type="checkbox"/> Occasionally flooded or inundated | 2 types present: points = 1 | |
| <input checked="" type="checkbox"/> Saturated only | 1 types present: points = 0 | |
| <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland | | |
| <input type="checkbox"/> Lake Fringe wetland | | 2 points |
| <input type="checkbox"/> Freshwater tidal wetland | | 2 points |

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*

- | | | | |
|-----------------|----------------|------------|---|
| If you counted: | > 19 species | points = 2 | 1 |
| | 5 - 19 species | points = 1 | |
| | < 5 species | points = 0 | |

H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

**None** = 0 points**Low** = 1 point**Moderate** = 2 points

2

All three diagrams
in this row are
HIGH = 3 points

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i>		3
<input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) <input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland <input checked="" type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) <input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>) <input type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>) <input type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)		
Total for H 1		
Add the points in the boxes above		
9		

Rating of Site Potential If Score is: ☐ 15 - 18 = H ☒ 7 - 14 = M ☐ 0 - 6 = L Record the rating on the first page

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>). <i>Calculate:</i> 0 % undisturbed habitat + (<u>3</u> % moderate & low intensity land uses / 2) = 1.5%		
If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0		0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. <i>Calculate:</i> 34 % undisturbed habitat + (<u>33</u> % moderate & low intensity land uses / 2) = 50.5%		
Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0		3
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0		
Total for H 2		0
Add the points in the boxes above		3

Rating of Landscape Potential If Score is: ☐ 4 - 6 = H ☒ 1 - 3 = M ☐ < 1 = L Record the rating on the first page

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.		
Site meets ANY of the following criteria: points = 2 <input checked="" type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan		2
Site has 1 or 2 priority habitats (listed on next page) within 100m points = 1		
Site does not meet any of the criteria above points = 0		

Rating of Value If Score is: ☒ 2 = H ☐ 1 = M ☐ 0 = L Record the rating on the first page

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

<http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here:

<http://wdfw.wa.gov/conservation/phs/list/>

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☒ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☒ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? <input type="checkbox"/> The dominant water regime is tidal, <input type="checkbox"/> Vegetated, and <input type="checkbox"/> With a salinity greater than 0.5 ppt <input type="checkbox"/> Yes - Go to SC 1.1 <input checked="" type="checkbox"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No - Go to SC 1.2	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? <input type="checkbox"/> The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) <input type="checkbox"/> At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. <input type="checkbox"/> The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Category II	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? <input type="checkbox"/> Yes - Go to SC 2.2 <input type="checkbox"/> No - Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? <input type="checkbox"/> Yes = Category I <input checked="" type="checkbox"/> No = Not WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf <input type="checkbox"/> Yes - Contact WNHP/WDNR and to SC 2.4 <input type="checkbox"/> No = Not WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? <input type="checkbox"/> Yes = Category I <input type="checkbox"/> No = Not WHCV	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? <input type="checkbox"/> Yes - Go to SC 3.3 <input type="checkbox"/> No - Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? <input type="checkbox"/> Yes - Go to SC 3.3 <input checked="" type="checkbox"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No - Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? <input type="checkbox"/> Yes = Is a Category I bog <input type="checkbox"/> No = Is not a bog	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

- ☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.
- ☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☒ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

- ☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks
- ☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☒ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

- ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).
- ☐ At least $\frac{3}{4}$ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
- ☐ The wetland is larger than $\frac{1}{10}$ ac (4350 ft²)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

- ☐ Long Beach Peninsula: Lands west of SR 103
- ☐ Grayland-Westport: Lands west of SR 105
- ☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☒ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☒ **NO** - go to 2

☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)**

☐ **YES - Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands.*

*If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☒ **NO** - go to 3

☐ **YES** - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☒ **NO** - go to 4

☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☐ The wetland is on a slope (*slope can be very gradual*),

☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☐ The water leaves the wetland **without being impounded**.

☒ **NO** - go to 5

☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,

☐ The overbank flooding occurs at least once every 2 years.

☒ **NO** - go to 6

☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7

☒ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8

☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. **GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT** (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as **Depressional** for the rating.*

NOTES and FIELD OBSERVATIONS:

DEPRESSIONAL AND FLATS WETLANDS**Water Quality Functions** - Indicators that the site functions to improve water quality**D 1.0. Does the site have the potential to improve water quality?****D 1.1. Characteristics of surface water outflows from the wetland:**

Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet).

points = 3

Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet.

points = 2

☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing

points = 1

☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch.
